DAN GOLENPAUL

Foreword

The 1958 edition of the Information Please Almanac will be the 12th since we began publication in 1947. Our purpose from the outset was to develop a modern readable almanac that would serve the many important needs for information and guidance in our daily lives. We think we have successfully met the test of time and the test of public acceptance.

Although a part of each edition is of necessity standard and unchanged, the greater portion of material is new each year. The Information Please Almanac is in a continual state of editorial development. Every new edition includes major new features that we believe are available only in our book.

The editorial content of the Information Please Almanac combines scholarship and popular interest. We never take our readers' acceptance for granted. Each new edition is a challenge to produce a better book providing greater usefulness.

We also would like to think ours is the perfect book since we have gone to great pains to avoid errors. All material is carefully scrutinized many times. You, though, may spot an error that everybody missed; if so we would like to hear about it. We promise to correct the error and this we gratefully advise will be your only reward.

NEWS RECORD OF 1957

See "OPERATION NEWS," page 20
A Guide to Newspaper Reading

(Separate articles beginning on page 16 give more specific information on Labor, Russia, Zhukov and Red Moon)

JANUARY 1957

GRINNING FROM ear to ear, a neatly dressed man in Waterbury, Conn., admitted that he was one of the nation's weirdest and most elusive criminals—"The Mad Bomber." Over the course of 16 years he had been making bombs, 47 in all, in his garage and planting them in public places in the New York area to spite the Consolidated Edison Co. Following the arrest of George Metesky, many other persons fancied the idea of bomb planting. Police in the North Atlantic States tracked down some 300 telephoned bomb warnings—all hoaxes. Most of them came from kids wanting to scare their schools into closing for the day . . . Two famous American expatriates hit the headlines. In the pink palace in Monaco, Princess Grace (nee Kelly of Philadelphia) gave birth to Princess Caroline Louise Marguerite, to the immense joy of the jittery father, Prince Rainier III. And Ingrid Bergman made her first visit to the U. S. in almost 8 years. In a 36-hour stay, she got a film critics' award and a jungle-gym for her small boy . . . In London there was a rather sad political changing of the guard. For 21 years Sir Anthony Eden had hoped to be Prime Minister of England; when he finally achieved it, he lasted 21 months, then resigned . . .

1 Eisenhower orders additional over-the-quota Hungarian refugees to be admitted.

1 Khrushchev unexpectedly toasts Stalin.

3 Democrats organize the Senate when Gov. Frank Lausche of Ohio votes with them.

4 Senate beats, 55 to 38, attempt to check filibusters.

5 Eisenhower asks special joint session of Congress for power to use military and economic aid in Middle East—the Eisenhower Doctrine.

6 967 Egyptian Jews deported to Naples.

7 Chinese Communist Premier Chou En-lai makes pilgrimage to Moscow, praising Soviet leadership.

EDEN RESIGNS

Jan. 9 Prime Minister Anthony Eden, 59, resigned after only 21 months in office. He gave ill health as the reason, but many people thought the fiasco of the British-French attack in Suez was a contributory factor. Eden went to New

Zealand for a rest. In April he went to Boston and underwent bile-duct surgery. In May he returned to England and went into retirement.

10 Harold Macmillan, Chancellor of the Exchequer, named British Prime Minister.

10 Eisenhower warns of inflation peril in State-of-the-Union message.

12 Hungary decrees death penalty for strikers.

13-15 Eisenhower flies to drought area; Tex., Okla., N. Mex., Ariz., Colo., Kans.

14 U. S. gives U. N. new 5-point plan for arms reduction.

15 Egypt announces seizure of British and French banks effective Jan. 16.

16 Eisenhower budget up \$3 billion to \$71.8 billion.

17 Khrushchev ends "de-Stalinization," praising Stalin as a great Communist.

18 Russia and Red China jointly denounce Eisenhower Doctrine and promise protection to Middle East countries.

18 3 U. S. B-52 jet bombers return after around world non-stop flight in record 45 hours 19 minutes.

19 Egypt, Saudi Arabia and Syria promise Jordan \$36 million annual subsidy so it can cut British tie.

20 Eisenhower and Nixon take oaths of office in private. Public inauguration Jan. 21.

20 Wladyslaw Gomulka wins vote of confidence in Polish election.

THE MAD BOMBER

Jan. 21 George P. Metesky, 54, arrested as New York's "Mad Bomber." He had strewn 32 homemade bombs in public places over the course of 16 years, injuring fifteen persons. He had a real or fancied grievance against the Consolidated Edison Co., for which he had worked 27 years ago, blaming it for a case of tuberculosis and failure to compensate him. In his mind, the bombs were revenge against Con Ed and its customers. He was taken care of by his sisters in Waterbury, Conn., and drove a big car to strew his bombs. In April he was removed to New York State's Matteawan Hospital

for the criminally insane, suffering from tuberculosis described as incurable.

- 22 H. Meade Alcorn, Jr. of Connecticut is new Republican National Chairman.
 - 25 F.B.I. arrests 3 in New York as Russian spies.
 - 26 Indian-occupied sector of Kashmir and Jammu formally becomes part of India.
 - 28 Eisenhower asks Federal fund of \$2 billion for a 4-year school building program.
 - 28 Symington Senate subcommittee says U. S. is losing air supremacy race to Russia.
 - 28 Defense Secretary Wilson says youths dodged Korean War by joining National Guard.
 - 29 King Saud of Saudi Arabia snubbed by New York's Mayor Wagner on arrival to visit Eisenhower.
 - 30 House passes Eisenhower Mid-East Doctrine, 355 to 61.
 - 31 Air liner crashes into California schoolyard after collision with jet fighter.
 - 31 Eisenhower urges Congress to liberalize immigration law.
- DIED:* 14—Humphrey Bogart, 57; 16—Arturo Toscanini, 89.

FEBRUARY 1957

IN PARIS, Monsieur Christian Dior decreed that skirts should be 3 to 4 inches longer. By the rules of the game, this meant that the docile husbands of America would shell out \$ for wives' new garb . . . On the other hand, our free enterprise system was bending its brains to help us out of our problems. The Radio Corp. of America offered a portable electronic system for amateur fishermen; it shoots sound waves, hitting the fish and bouncing back to the old so-and-so with the pole, who thus cheatingly discovers where the poor fish is . . . Another new product, keeping pace with the advance of civilization, came from Sassy, International, Inc., which developed a beer that doesn't taste like beer. In deference to female customers, it tastes like some kind of cola, or perhaps rum punch, or perhaps Lydia Pinkham's Vegetable Compound . . . And furthermore, a psychiatric professor discovered a new neurosis. Audiophilia. It means an addiction to playing hi-fi records so loud that the sound "reaches the level of physical pain."

- 1 Tug strike cripples New York harbor.
- 1 Northeast Airlines Florida-bound air liner crashes at New York take-off, killing 20 of 101 aboard.
- 2 U. N. again calls on Israel to withdraw from Gaza Strip and Gulf of Aqaba.

- 2 Senate Election Subcommittee reports that 1956 Federal election campaigns cost \$33 million.
- 6 Russia puts 4 "spies" for U. S. on Moscow television.
- 7 Russia expels 2 U. S. military attaches as "spies."
- 8 Britain denies rumors of rift between Queen Elizabeth and her husband, the Duke of Edinburgh.
- 10 U. S. cuts price supports for 8 major farm products.
- 11 U. S. offers Israel pledges on Aqaba and Gaza if it will withdraw.
- 12 Dock workers (International Longshoremen's Association) resume strike from Maine to Virginia as 80-day Taft-Hartley law injunction expires.
- 15 Israel fails to accept U. S. pledges on Aqaba and Gaza.
- 16 Hungary concedes that 196,000 left the country since Oct., 1956.
- 17 Fire kills 71 in old folks' home in Warrenton, Mo.
- 18 Arthur Miller, playwright, indicted for contempt of Congress for silence about associates at Red probe.
- 19 Senate Democrats vote to oppose sanctions on Israel.
- 20 Eisenhower, on the air, says U. N. future depends on making Israel withdraw troops from Egypt.
- 21 Israel rejects Eisenhower appeal.
- 23 Premier Tanzan Ishibashi of Japan resigns; his successor is Foreign Minister Nobusuke Kishi.
- 24 Pope Pius XII approves use of drugs to ease painful deaths even if they might shorten life.
- 24 U. S. promises Israel to support keeping U. N. troops at Gulf of Aqaba.
- 25 Supreme Court rules 6 to 3 that professional football is a business subject to antitrust laws.
- 26 Senate opens inquiry on racketeering in labor unions.

MARCH 1957

FROM THE ISLAND of Trinidad came a fad. Calypso songs (mainly phoney) swept the pop-music business like nothing since rock 'n' roll. We were treated to Robert Mitchum croaking "Mama Look-a Booboo." And you could buy do-it-yourself Calypso Kits (bongo drums, a gourd and a pair of maracas) for \$24.50 and up . . . A labor boss created his own little fad. Dave Beck pleaded the Fifth Amendment 117 times (possibly a world's record) to avoid telling Senators what he had done with \$320,000 of Teamsters union funds . . . In a far part of the world there was something

really new. For the first time in the memory of civilization, a strictly peace-preserving international army—United Nations troops from Denmark, Norway, Sweden, India, Colombia—moved into the Gaza Strip to keep Egypt and Israel from clawing at each other . . . Here at home, General Motors came to the rescue of those frustrated people who couldn't find a sufficiently expensive car. It whipped out the Cadillac Eldorado Brougham, a name that conjured up the best features of the raucous California Gold Rush plus the snootiest British aristocracy. Cost only \$13,074 (a record for American cars) and gave you a tissue box, vanity case, lipstick and four gold-finished drinking cups.

- 1 Israel pledges "full and prompt withdrawal" from Gaza Strip and Gulf of Aqaba.
- 2 Eisenhower names Charles Evans Whitaker, Missouri judge, to Supreme Court.
- 4 Ben-Gourion orders Israeli withdrawal from Gaza and Aqaba despite protest demonstrations.
- 5 Eisenhower Doctrine for Mid-East passes Senate, 72 to 19. (March 7—House completes Congressional approval, 350 to 60.)

GHANA—NEW NEGRO NATION

Mar. 6 A new nation, Ghana, formerly the British colony in Africa known as the Gold Coast, attained full independence. It remained in the British Commonwealth as the first Negro member-nation. The name Ghana commemorates a Negro nation which flourished in Africa for 900 years until it disintegrated 500 years ago. (See "Other Nations of World" for additional details.)

- 6 U. N. troops take over Gaza Strip as Israelis leave.
- 8 U. N. troops take over at Gulf of Aqaba.
- 9 Egypt rejects American-backed plan to split Suez Canal tolls 50-50 with U. N.
- 11 Boeing jet makes fastest transcontinental passenger flight—Seattle to Baltimore in 3 hours 48 minutes.
- 12 Vice President Nixon discusses U. S. bases in Ethiopia with Emperor Haile Selassie.
- 13 40 killed in Havana as students try in vain to storm President Batista's palace.
- 13 FBI arrests on bribery charge James R. Hoffa, vice president of International Brotherhood of Teamsters.
- 14 Egypt sends new governor into Gaza Strip.
- 14 Martial law in Indonesia as outer islands rebel against Java government.

17 President Magsaysay of the Philippines killed in plane crash. Vice President Garcia succeeds him.

18 4 high officers of Teamsters' Union indicted for contempt of Senate for silence at inquiry.

20 Pres. Eisenhower and Prime Minister Macmillan meet in Bermuda for talks.

21 Vice President Nixon returns from 20,000-mile African tour.

22 San Francisco has worst quake since 1906; no deaths.

24 U. S. agrees to give Britain guided missiles capable of reaching Moscow.

22-26 Blizzards kill 48 in 10 Great Plains states.

25 6 nations sign in Rome treaties for Euratom (pooling of atomic resources) and tariff-free common market.

26 Air Force Chief Gen. Nathan Twining appointed to succeed Adm. Radford as Chairman of Joint Chiefs of Staff.

26 Dave Beck, Teamsters union president, invokes 5th Amendment 117 times at Senate inquiry.

27 2 U. S. aid officials killed by bandits in Iran; wife of one is kidnaped. (Found dead Mar. 31.)

29 AFL-CIO suspends Dave Beck as vice president.

30 Navy commissions 2nd nuclear-powered submarine, *The Seawolf*.

DIED: 11—Adm. Richard E. Byrd, 68; 28—Christopher Morley, 66.

APRIL 1957

SOME OF US THOUGHT World War III might break out. The powerful U. S. 6th Fleet (perhaps 50 ships in all) steamed with dramatic suddenness to the eastern end of the Mediterranean Sea. The little kingdom of Jordan was in danger of being gobbled up by pro-Communist Egypt and Syria. But Jordan's young King Hussein (21), who had been called a playboy, had guts, saved country . . . Here at home, people were buying two automobiles instead of one. Two-car families shot up by 14%, and an estimated 25% of wives were badgering their husbands to buy another . . . People were forgetting that lung cancer might be encouraged by cigarette-smoking. The scare of 1953 wore off, and the Department of Agriculture estimated that 1957 cigarette sales would exceed last year's 392 billion, or 171 packs for every American above the age of 14.

1 U. S. lifts 5-month ban on travel by citizens to Egypt, Syria, Jordan and Israel.

2 Tornado kills 9 in Dallas, injures over 400.

- 3 Democrats retain control of Senate as Texas Republican loses to Ralph W. Yarborough, Democrat.
- 4 Britain announces drastic cut in armed forces; will rely on guided missiles with nuclear warheads.
- 6 First U. S. oil tanker sails Gulf of Aqaba to Israel; unmolested by Egypt.
- 7 Sir Anthony Eden goes to hospital in Boston.
- 8 Paris cheers Queen Elizabeth II and Prince Philip, beginning 4-day state visit.
- 8 Saudi Arabia extends for 5 years U. S. air base lease at Dhahran.
- 9 Britain cuts taxes.
- 10 Mr. and Mrs. Jack Soble plead guilty to spying for Russia.
- 13 Post offices closed; no mail deliveries. Postmaster General Summerfield battles Congress for more money.
- 14 King Hussein of Jordan ousts pro-Egyptians and pro-Communists from government.
- 15 Congress votes \$41 million extra for Post Office, ending squabble that caused curtailment of mail deliveries.
- 17 Charles Van Doren, winner of \$129,000 on television quiz, marries Geraldine Ann Bernstein.
- 17 Archbishop Makarios, Ethnarch of Cyprus, freed, arrives in Greece after 13 months of British banishment.
- 19 Russia warns West of retaliation if East Germans revolt.
- 20 Replica of *Mayflower* sails from Plymouth, England, for Plymouth, Mass.
- 22 Dulles denies U. S. incites satellite revolts but predicts they will win freedom in time.
- 24 Egypt gives Suez Canal plan to U. N.
- 24 Eisenhower warns that U. S. regards independence of Jordan as vital.
- 25 U. S. orders 6th fleet to Middle East waters; King Hussein puts Jordan under martial law.
- 26 U. N. to try Egypt Suez plan, although not liking it.
- 28 One-way airways envisaged in new U. S. plane control plan.
- 29 U. S. grants \$10 million aid to Jordan with no strings.
- 30 Russia offers U. S. a trade on "open skies" aerial inspection.

MAY 1957

MAN OF THE MONTH was the Rev. Dr. William Franklin Graham, 38, known as Billy. Having preached to some 18 million persons throughout the world, he invaded New York for the greatest evange-

listic crusade the nation has experienced. Up to 18,000 persons heard him preach every night, except Mondays, week in and week out in Madison Square Garden; and each night several hundred went down front to make "decisions for Christ." Original budget for the crusade: \$900,000, of which \$225,000 was allotted for publicity and advertising . . . In Washington, one of the most controversial figures of his time died at the age of 48: Sen. Joseph R. McCarthy, R., Wis. . . . Also in Washington, there was a storm over President Eisenhower's whopping \$71.8 billion budget, and one of the critics was his own brother, Edgar. Lapel buttons saying "I like Edgar" appeared . . . The columnists decided that Elvis Presley was the highest-paid movie star ever; he was in Hollywood to star in his third picture, "Jailhouse Rock," for an honorarium of \$250,000 plus half the profits . . . Times were indeed good. A drive-in restaurant in Texas treated its automobile patrons to mobile air conditioning along with the french-fries.

- 2 Sen. Joseph R. McCarthy (R. Wisc.) 48, dies of acute hepatic failure in Bethesda Naval Hospital in Maryland.
- 2 Dave Beck indicted for evading \$56,419 taxes in 1950.

COSTELLO SHOT

May 2 Frank Costello, a gambler with nationwide operations, suffered a slightly nicked skull when somebody shot at him as he was entering his New York City apartment. Taken to the hospital, police found in his pocket a memorandum of "gross casino wins" of \$651,284. The figure corresponded (according to the N. Y. District Attorney's office) with the gross win of the new Tropicana Hotel in Las Vegas, Nev. Costello refused to talk about a possible assailant, and refused to explain the "gross wins" memorandum. For this he was sentenced to 30 days in jail for contempt, but was released after 15 days, pending appeal. On Aug. 19, a small-time gambler named Vincente Gigante, a former prize-fighter, was arrested on suspicion of having been Costello's assailant.

- 3 Most of U. S. 6th Fleet recalled from eastern Mediterranean as Jordan remains calm under King Hussein.
- 6 Italian Cabinet of Premier Antonio Segni overthrown.
- 7 U. S. sends guided missile unit to Formosa.

- 7 Gambler Frank Costello jailed for contempt; he refuses to explain \$651,284 "casino wins."
- 7 Russia announces plan to decentralize industry control.
- 8 Dave Beck, teamster union boss, pleads Fifth Amendment 29 more times.
- 10 Dictator of Colombia, Gen. Gustavo Rojas Pinilla, overthrown by popular uprising.
- 12 King Saud of Saudi Arabia visits Iraq to bolster Mid-East anti-Communist and anti-Egyptian stand.
- 12 The Marquis Alfonso de Portago, noted Spanish auto racer, killed in Italy's Thousand Mile race.
- 13 Britain ends boycott of Suez Canal.
- 14 Eisenhower pleads for budget on television.
- 15 Billy Graham opens 47-day New York crusade.
- 15 British set off their first H-bomb over mid-Pacific.
- 16 U. S. launches third and smallest atomic submarine, the *Skate*, at Groton, Conn.
- 20 Dave Beck expelled from A.F.L.-C.I.O. council.
- 21 Eisenhower warns foreign aid cut could mean war.
- 21 Socialist Premier Guy Mollet of France resigns after sixteen months in office, longest post-war tenure.
- 23 New Swedish-American *Gripsholm*, biggest Scandinavian liner, greeted in New York.
- 24 Anti-American riots in Formosa wreck U. S. Embassy.
- 25 Dave Beck announces he won't run again for Teamsters' Union presidency.
- 27 West Germany again appeals to Russia for negotiations on Germany re-unification.
- 28 U. S. sets off first atomic blast in new series in Nevada.
- 30 British defy U. S. wishes and relax ban on trade with Red China.
- 31 Arthur Miller, playwright, found guilty of contempt of Congress for refusing to name Communists he knew in 1947.

DIED: 1—Sen. Joseph R. McCarthy (R., Wisc.), 48; 9—Ezio Pinza, 64.

BOY IN WELL

May 16 Benny Hooper, 7, fell into a well which his father, a truck driver, had been digging in the back yard of their home in Manorville, L. I. His father had found water in the sand 21 feet down. Benny's cries could be heard for an hour and then sand seeped down on him. An oxygen hose was forced down to him. All that night and all the next day rescuers dug a parallel shaft a few feet away and then tunneled toward Benny. Nearly everyone believed Benny must be dead. At 7:10 p.m. May 17 a rescuer reached Benny and pulled him to the surface. He was alive, and he recovered.

GIRARD ACCUSED

May 16 Army Specialist 3/c William S. Girard, of Ottawa, Ill., will be turned over to Japan for trial, U. S. military authorities announced. Girard was accused of fatally shooting a Japanese woman while trying to scare her off a U. S. rifle range. (Shooting happened Jan. 30.) On May 17, Secretary of Defense Wilson ordered he not be turned over to Japanese. The Supreme Court ruled July 11 that U. S. status-of-forces agreement with foreign countries was constitutional, so the government was within its

rights in turning Girard over to Japan for trial. His trial in a Japanese court opened Aug. 26.

JUNE 1957

SHIP OF THE MONTH was Mayflower II—a rebirth of the Pilgrims' little trans-Atlantic liner that brought millions of so many of our ancestors to these shores. The new Mayflower bobbed across in 53 days, beating the Pilgrims' time by 14 days and their profits by quite a wampum. After touching Plymouth, she touched gold in New York, where sightseers flocked aboard at 95¢ a throw . . . We were treated to two scares. The American Cancer Society told us 2-pack-a-day cigarette smokers died of lung cancer in a ratio of 20 to 1 as compared to non-smokers. And geneticists told us that merely testing the H-bomb would mean "hundreds of thousands of persons will be diseased or deformed or will die prematurely." . . . Undaunted, we went joy-riding in the pint-sized foreign cars. The fancy sport models from abroad no longer were concentrated on the East Coast, but were buzzing throughout the Mid-West. In 1955 we bought only 56,000 copies; in 1956 another 100,000; and it looked like the itch would double the sales in 1957. . . . There was a hubbub about the Supreme Court—too radical. *The Daily News* of New York suggested impeachment of Justices. Columnist David Lawrence favored popular election of the Justices. . . . In Paris,

justice caught up with the eminent party-giver, Elsa Maxwell. She had to pay \$840 damages to former King Farouk of Egypt for telling him she did not associate with "clowns, monkeys, depraved people or malefactors."

- 2 Khrushchev interviewed on U. S. television.
- 3 Supreme Court rules that Du Pont controls General Motors in violation of anti-trust laws.
- 4 U. S. agrees to let Japan try Army Specialist 3/C William S. Girard for killing Japanese woman.
- 4 Dave Beck, Jr. pleads 5th Amendment 124 times before Senate rackets investigation.
- 4 American Cancer Society reports "spectacular" relationship between cigarette smoking and lung cancer.
- 5 American Medical Association condemns use of stimulant amphetamine pills by athletes.
- 6 Auto industry decided to de-emphasize speed and horsepower in promotion.
- 7 U. S. grants \$48.9 million loan aid to Communist Poland.
- 9 Sen. Knowland suggests dropping Norway from NATO in exchange for Russian withdrawal from Hungary.
- 10 President Eisenhower makes quick recovery from "mild stomach upset."

CONSERVATIVES WIN IN CANADA

June 10 Conservative Party wins Canadian election, ousting the Liberals after they had been in power for 22 years. New Prime Minister is John Diefenbaker. The Conservatives indicated that they did not intend to change the welfare-state aspects introduced by the long Liberal regime.

MAYFLOWER II ARRIVES

June 12 Mayflower II reaches Provincetown, Mass., after sailing fifty-three days across the Atlantic from Plymouth, England. The ship was built to resemble as closely as possible the original Mayflower which brought the Pilgrims across the ocean in a voyage fourteen days longer. After exhibition in Provincetown and Plymouth, the Mayflower II was put on exhibition at New York. The skipper was Capt. Alan Villiers, author and lecturer.

- 13 Harold E. Stassen returns to London disarmament talks after denying reprimand by Dulles; his role is curbed.

- 14 Senate passes \$3.6 billion foreign aid bill, 57-25.
 - 16 Strike ties up French Line trans-Atlantic ships at start of tourist rush.
 - 17 Supreme Court restricts Congressional inquiries; frees 5 Reds in Smith Act case.
 - 18 House passes Civil Rights bill, 286 to 126.
 - 18 Federal court in Washington rules U. S. must not let Japan try Army Specialist 3/C William S. Girard.
 - 18 Senate Finance Committee opens broad investigation of U. S. fiscal policies.
 - 20 U. S. to send modern weapons including jet atomic bombers, to Korea to counter Red's build-up.
 - 20 U. N. inquiry report on Hungary blasts Russia.
 - 21 Premier Kishi of Japan, visiting Eisenhower, gets pledge U. S. will withdraw ground combat troops from Japan.
 - 21 John Diefenbaker, Conservative leader, becomes Premier of Canada.
 - 21 Adone Zoli changes mind, will accept Italian Premiership; longest Cabinet crisis ends.
 - 21 Sweeping changes in U. S. security program urged by bipartisan committee.
 - 23 3 Russian naval vessels pass through Suez Canal—first since 1917.
 - 24 Eisenhower asks Federal-state survey on returning Federal tasks to states.
 - 24 Scientists tell Eisenhower we now can produce nuclear weapons 95% free of radioactivity.
 - 25 U. S. offers 3-state reduction in armed forces to 1.7 million if Russia will do likewise.
 - 27 U. S. Steel announces \$6-a-ton price raise July 1.
 - 27 Hurricane Audrey hits Louisiana-Texas border; 275 estimated dead.
 - 29 Army sentences Col. John C. Nickerson, Jr. to forfeiture of \$1,500 pay for leaking missile secrets.
 - 30 Tito of Yugoslavia, on U. S. TV, backs Red China's version of Communist line.
 - 30 International Geophysical Year starts; to last 18 months.
- DIED: 12—Jimmy Dorsey, 53; 12—Peggy Hopkins Joyce, 62.

JULY 1957

ITCHING TO GET SOME PLACE where they weren't, footloose Americans went abroad in the most mammoth migratory herd of all time—about 2 million. 76 liners were hauling them, and hundreds of planes. In their pockets jingled \$2 billion,

itching to get spent, and the people in foreign parts were not loath to help out . . . In one foreign part there was an upheaval. Not in 2 decades had there been such a shake-up in Soviet Russia's ruling hierarchy. Out went Molotov, last of the elder Bolsheviks; out went Malenkov, protégé of Stalin; out went Kaganovich. Supreme (for the moment, at least) was Khrushchev, the ebullient, hard drinking ex-miner . . . Here at home the man who made good was corny, twangy Jimmy Dean, whose country music on the accordion was pushing him up into the \$100,000-a-year bracket on TV . . . The ludicrous gal who fell short of making good was Leona Gage who was named Miss United States over 44 other lovelies, and was showered with prizes. But she was unceremoniously uncrowned when it turned out she was not Miss, but Mrs., mother of 2 sons . . . The new word "moonlighting" was introduced to us. Despite prosperity, or because of it, the number of workers who had one job in daytime and another at night rose to 3,700,000. For example, a Chicago worker went to his shopping center to buy a suit, and the clerk who fitted him was his boss . . . Still working nights was Billy Graham, who on one of the hottest New York nights of the year drew a crowd estimated at 100,000 in Yankee Stadium. It broke all records; largest previous Yankee Stadium crowd was 88,150 for the Joe Louis-Max Baer heavyweight fight in 1935.

- 1 Mayflower II arrives in New York.
- 2 U. S. proposes 10-month moratorium on nuclear weapons tests.
- 3 Russia announces dismissal from Presidium of Malenkov, Molotov, Kaganovich, Shepilov (action taken June 29).
- 5 Biggest atomic explosion in U. S., fired in Nevada, shakes most of west.
- 6 Khrushchev charges Malenkov framed 1949 purge in Leningrad.
- 7 Holiday traffic death toll estimated at 370.
- 9 Harlem hails Althea Gibson, home from winning Wimbledon championship.
- 10 Moscow radio says Malenkov will manage power plant in East Kazakhstan. Others purged will get new jobs, unspecified.
- 11 Supreme Court affirms, 8-0, legality of letting Japan try Army Specialist 3/C William S. Girard in killing of Japanese woman.
- 12 Will of Aga Khan III by-passes his son, Aly, and names as his successor Aly's son, Prince Karim Khan, a junior at Harvard.

- 14 Rumanian Cabinet shaken up after purge of 2 top Reds called "Stalinist."
 - 16 Administration orders armed forces cut by 100,000.
 - 16 Navy jet sets record crossing U. S. in 3 hours, 23 minutes, 8.4 seconds.
 - 18 Horace Stoneham says this is Giants' last year in Polo Grounds.
 - 19 James R. Hoffa, Teamster's Union vice-president acquitted of planting spy on Senate rackets committee.
 - 20 Billy Graham crowd of 100,000 is biggest ever in Yankee Stadium.
 - 21 Holy Trinity Church in Brooklyn closed by Bishop in controversy between two rectors.
 - 23 John Kasper and six from Clinton, Tenn., convicted of contempt for segregationist mob action.
 - 24 British jet planes attack rebels in Sultanate of Muscat and Oman.
 - 25 Tunis ousts Bey, becomes a republic.
 - 25 Federal aid for school construction killed in House, 208-203.
 - 27 Anti-communist President Carlos Castillo Armas of Guatemala slain by communist palace guard.
 - 28 Quake kills 56 in Mexico, including 36 in Mexico City.
 - 29 Robert B. Anderson succeeds George M. Humphrey as Secretary of the Treasury.
 - 30 Illinois Governor refuses to free Nathan Leopold, 33 years in prison for thrill murder.
 - 31 Nazi documents reveal plan to make Duke of Windsor puppet King of conquered England.
- DIED:** 11—Aga Khan, 79; 24—Sascha Guitry, 72; 21—Kenneth Roberts, 71.

AUGUST 1957

DOG DAYS NOTE: The meat industry revealed that the average American gulped 57 hot dogs (officially known as weiners) in 1956, which was 3 more than in 1955. These Americans were still so hungry that they were expected to gobble 10.1 billion hot dogs in 1957, which, if linked together, would go around the world 30 times. Switching to a different type dog, Rover is now in clover. He may not know it, but if he dies he can leave a bequest to his owners. The Animal Insurance Company of America was licensed by New York State to write canine life insurance which will insure a pedigreed dog up to \$5,000. . . . Most of us were too busy vacationing to worry about an ominous development in the Middle East: A Communist general seized power in Syria, which made it seem probable that Soviet Russia had won a new satellite in the

midst of the vital Middle East oil region. Also, Moscow told us that it had achieved and successfully tested the ultimate weapon which could destroy us all—the ICBM (intercontinental ballistic missile) capable of popping an H-bomb some 5,000 miles. . . . Nevertheless, we here at home were boosting the efficiency of our workers with Muzak. They seemed to be happier when “Cindy, Oh Cindy” came softly to the ears of drill press operators in Burbank, Calif., and baby-powder packers in Chicago.

- 2 Senate weakens civil rights bill by voting jury trial amendment; Eisenhower angered.
- 3 Dulles, in London, presents West's plan for aerial and ground inspection of Russia, U. S., most of Europe.
- 3 Moscow announces new Khrushchev-Tito accord for “co-operation.”
- 5 New York takes 600 learners out of Police Academy to combat youth gangs that killed 22 since Jan. 1.
- 6 Mrs. Eisenhower operated on; nothing malignant.
- 7 Senate passes weakened civil rights bill, 72 to 18.
- 7 Khrushchev visits East Berlin—leaving Bulganin at home.
- 7 Soviet Col. Rudolf I. Abel indicted in Brooklyn as top spy.
- 8 Wiretaps link gangster Johnny Dio to Teamsters' James R. Hoffa. Dio pleads 5th 146 times.
- 10 France devalues franc 20% for tourists.
- 11 British capture headquarters of Oman rebels in Arabia, ending rebellion.
- 11 79 in airliner die in Quebec crash on vacation trip.
- 12 Boris Morros tells of role as 12-year spy for F.B.I. against Russian spies.
- 13 Asiatic influenza comes to New York on liner Arosa Sky, with 27 ill; one dies.
- 14 41 U. S. youths defy State Department ban and leave Moscow for visit to Red China.
- 15 Johnny Dio indicted as \$20,169 income tax evader.
- 17 Boris Morros tells House committee that Mrs. Martha Dodd Stern was a Soviet agent. (Sterns flee to Czechoslovakia.)
- 18 Pro-Soviet army officers execute coup in Syria, taking over power.

N. Y. GIANTS MOVE

- Aug. 19 The New York Giants baseball team would shift their home base to San Francisco in 1958 after 74 years in New York, Horace Stoneham, Giants president; an-

nounced. Attendance at the Polo Grounds slipped from 1,600,000 in 1947 to 629,000 in 1956. Pay television on the Pacific Coast was expected to boost profits.

- 20 Air Force balloonist sets altitude record, ascending more than 100,000 feet—about 19 miles.
- 20 James R. Hoffa, on Senate witness stand, says he got \$120,000 in loans without security.
- 21 U. S. offers to halt nuclear weapons tests for 2 years.
- 22 State Department, reversing itself, lets 24 news correspondents go to Red China.
- 26 Red China balks at admitting American news correspondents.
- 26 Moscow claims successful test of intercontinental ballistic missile.
- 26 Trial of Army Specialist 3/c William S. Girard opens in Japanese court in Makbashi.
- 27 Wisconsin vote upset elects William Proxmire, Dem., to Senate seat McCarthy held.
- 29 Sen. Strom Thurmond, Dem., S. C., completes speech of 24 hours, 27 minutes, setting filibuster record.
- 30 Congress approves \$3.4 billion foreign aid; adjourns.

MALAYA NEW NATION

- Aug. 31 The Federation of Malaya came into existence as the newest free nation in the world. British rule ceased, but Malaya remained a member of the British Commonwealth. Seventeen days later it was admitted as the eighty-second member of the United Nations. The Malayan states were brought under British rule in the late 19th century as a result of commercial and political penetration. They bear names strange to Occidental tongues—Trengganu, Kelantan, Negri Sembilan, etc. Britain and Malaya announced a defense alliance permitting British troops to be stationed there as protection against possible Chinese aggression.

DIED: 4—Walter F. George, 79; 7—Oliver Hardy, 65.

SEPTEMBER 1957

OMINOUS ECHOES of the Civil War days nearly a century ago filled the land. U. S. Army paratroopers with fixed bayonets moved into Little Rock, Ark., to

suppress a mob trying to block the entry of 9 Negro pupils into a formerly all-white high school of 2,000. Arkansas was "occupied territory," said its enraged Gov. Faubus. . . . In New York, Evangelist Billy Graham wound up his marathon 16-week preaching stint in which 2 million persons came to hear him. But his staff didn't see eye-to-eye with the New York City police about the size of the crowd at the final open-air rally in Times Square. Staff said 120,000 attended. Police said 75,000. . . . Crowds, alas, also flocked to a new-type horror movie called "I Was a Teenage Werewolf," which took in a monstrous \$1,700,000. . . . And the women were flocking to the beauty parlors by the millions to get their hair tinted practically any color it wasn't already—colors such as Golden Apricot, Sparkling Sherry, Fire Silver and Champagne Beige. Estimated tinted women: 1 out of 3. . . . Among the happiest people in the sports-goods business as the summer ended were the water-ski makers, for they were experiencing boom sales at the rate of 250,000 pairs worth \$6,500,000, half again as many as in 1956; and to make the skis go, people were buying outboard boats at the rate of \$18,000,000 worth. . . . Not so happy were the stock market investors, for the total of stock values was slipping, slipping—a billion today, couple billion tomorrow.

- 1 Final meeting of Billy Graham crusade packs Times Square, N. Y.
- 3 Holiday traffic accidents kill 375.
- 3 Gov. Orval Faubus of Arkansas blocks court-ordered school racial integration with National Guard.
- 3 Congress enacts bill restricting use of FBI files in Federal courts to records found relevant by judge.
- 4 First Russian jet airliner lands in U. S.
- 6 U. N. disarmament talks in London recess indefinitely in deadlock after 5½ months.
- 7 Eisenhower vetoes bills to increase salaries of postal employees and Civil Service employees.
- 9 U. S. planes fly emergency shipment of arms into Jordan.
- 10 Nashville, Tenn., police arrest John Kasper and other racist agitators after the dynamiting of a new school.
- 11 Pope Pius tells Catholic bishops to keep watch on morals of radio and TV.
- 12 Syria announces its army is united with Egypt's under Egyptian supreme command.
- 15 Adenauer wins West German election; biggest free vote in German history.
- 16 Army seizes Thailand in bloodless coup.
- 17 Malaya admitted as 82nd U. N. member as 12th General Assembly opens.

- 18 Johns Hopkins University scientist reports vaccine achieved against 1 of many viruses causing common cold.
 - 19 Defense Dept. orders 2nd cut of 100,000 in armed services.
 - 20 Federal court enjoins Gov. Faubus in Little Rock; he withdraws National Guard from school.
 - 21 Air Force Capt. George H. French sentenced to life for trying to sell secrets to Russians.
 - 23 Mob in Little Rock beats Negro reporters as 9 Negro pupils are spirited into high school.
 - 24 Eisenhower sends Army troops to Little Rock to quell mob and protect school integration.
 - 24 U. S. Coast Guard cutters complete trip around North America through Northwest Passage.
 - 25 U. S. Air Force fails in second attempt to test-fire intercontinental ballistic missile, the Atlas.
 - 28 Eisenhower accuses Faubus of encouraging Little Rock mob to block school integration.
 - 29 N. Y. Giants lose last game in Polo Grounds to Pittsburgh Pirates, 9 to 1.
 - 29 Pope Pius XII tells women they must subordinate themselves to men in marriage.
 - 30 Cabinet falls in France on Algeria issue; Premier Bourges-Maunoury resigns.

OCTOBER 1957

WE GASPED. It couldn't be. But there it was, some 500 miles up in the sky. You could see it. High-powered radio stations could hear the beep-beep-beep of its radio transmitter. Russia's baby moon named Sputnik kept whizzing around and around the world, making the trip in a neat hour and a half. . . . Our alert toymakers did some whizzing, too. They came up with a miniature launcher which would shoot a little ball 75 feet into space. . . . But our second thoughts about Sputnik were grim. Maybe that Russian launching rocket could be turned in our direction with an H-bomb warhead.

- 1 International Atomic Energy Agency (for peaceful atom use) opens first conference in Vienna; 60 nations attend.
- 1 Japan wins two-year seat in U. N. Security Council as Russia's candidate, Czechoslovakia, is defeated.
- 2 New York City announces it has Asian flu epidemic.

- 3-4 Polish students fight police in Warsaw in protest against closing their weekly paper.
- 4 Russians launch first artificial satellite, circling globe at 18,000 miles an hour 560 miles up.
- 4 Teamsters union elects James R. Hoffa president by 3 to 1, despite threat of expulsion from AFL-CIO.
- 6 Russian earth-satellite sighted first time in U. S. at University of Alaska.
- 7 Russia announces test of new H-bomb designed as warhead for missiles.
- 7 Gov. Faubus charges Federal troops with "invading privacy of girls' dressing rooms" at Little Rock school.
- 9 Eisenhower voices concern on U. S. missiles program, but not on Russia's satellite.
- 10 U. S. warns Russia that it will defend Turkey if attacked.
- 12 Queen Elizabeth II and Prince Phillip arrive in Canada for four-day visit. (They visit the United States—Williamsburg, Washington and New York—Oct. 16-22.)
- 13 Egypt announces landing of armed forces in Syria to strengthen it against possible attack.
- 14 Federal judge in Washington temporarily bars Hoffa from taking Teamsters union presidency.
- 14 Nobel peace prize for 1957 goes to Lester B. Pearson, former Canadian Secretary for External Affairs.
- 15 Yugoslavia extends diplomatic recognition to East Germany, first non-satellite to do so.
- 16 Dulles says Russia faces U. S. blow at its territory if it attacks Turkey.
- 17 Nobel literature prize for 1957 goes to Albert Camus, French author.
- 19 West German government severs diplomatic relations with Yugoslavia in retaliation for its recognition of East Germany.
- 20 King Saud of Saudi Arabia offers to mediate Mid-East crisis involving Turkey and Syria. (Turkey later accepted mediation, but Syria rejected it.)
- 21 Supreme Court kills Virginia's "pupil placement" law to avoid school integration.
- 21 Stocks lose \$5.6 billion in a day for sharpest break in 2 years.

U. S. SENDS UP ROCKETS

- 21 In a stepped-up missile-rocket testing program, the Air Force sent a rocket higher than any object ever hurled by man. First calculations indicated more than 2,000 miles. It was carried up to about 100,000 feet by a balloon over Eniwetok Atoll in the Pacific, then fired, in Project Farside. On Oct. 22 the Army fired its Jupiter missile to a distance of 1,200 miles. On Oct. 23 the Navy sent its Vanguard missile to an altitude of 109 miles. On Oct. 24, the Air Force fired its intermediate range ballistic missile, Thor, to a distance estimated at 1,500 miles.
- 22 Anti-American bombings in Saigon, Vietnam, injure 13 U. S. service men.
- 23 Herbert Brownell, Jr., resigns as Attorney General; he will be succeeded by Deputy Attorney General William P. Rogers.
- 23 Stocks recover \$8 billion in biggest rise since Nov. 14, 1929.
- 23-25 Prime Minister Harold Macmillan of Britain confers with President Eisenhower in Washington.
- 24 Nobel Prize in Medicine for 1957 awarded to Dr. Daniel Bovet, Swiss-born naturalized Italian.
- 24 AFL-CIO suspends International Brotherhood of Teamsters for "corrupt influences."
- 25 Albert Anastasia, underworld king who beat 5 murder raps, is murdered in N. Y. C. barbershop.
- 25 Russian Col. Rudolf Ivanovich Abel found guilty in Brooklyn Federal court of spying in U. S.
- 26 Marshal Georgi Zhukov replaced by Marshal Malinovsky as Soviet Defense Minister.

DIED: 22—Christian Dior, 52.

HEADLINE STORIES OF 1957

LABOR

AT THE BEGINNING of 1957 the Senate established a Select Committee on Improper Activities in the Labor or Management Field, consisting of 4 Democrats and 4 Republicans. The chairman was Sen. John L. McClellan, D., Ark. The chief counsel was Robert F. Kennedy.

As the inquiry continued through the spring, summer and autumn, three indi-

viduals in the labor movement emerged prominently. They were:

Dave Beck, president of the International Brotherhood of Teamsters.

James R. Hoffa, vice-president of the Teamsters and its Mid-West boss, who hoped to succeed Beck as president.

Johnny Dio (real name Dioguardi), a

twice-convicted labor extortionist, operating chiefly in New York City.

Beck

The broad pattern developed by the Senate investigators in the case of the Teamsters was one of co-operation between the underworld and Teamsters officials. For example, evidence was introduced that the union forced closing of establishments that refused to use the pinball machines controlled by the union-underworld combine. The Teamsters was called the largest union in the nation, although there was some dispute as to size between it and the United Automobile Workers.

When Dave Beck took the witness stand before the Senate committee he was asked what happened to some \$320,000 absent from the treasury of the Teamsters in Seattle, the union's headquarters. Did Beck take \$85,000 to pay personal bills? Did Beck take \$36,000 to pay personal loans? Etc., etc.

Beck, on the Senate witness stand, "took the 5th" 209 times. That is, he invoked the Fifth Amendment to assert his right of avoiding possible self-incrimination. He refused to answer the questions about what became of the union's \$320,000.

As a result of this, the AFL-CIO suspended Beck as a vice-president. That action did not affect Beck's presidency of the Teamsters. But the AFL-CIO held over the Teamsters the threat that this union might be expelled from the over-all organization unless it cleaned house.

Trouble accumulated for Beck. He was arrested on charges of evading \$56,419 in Federal income taxes.

Beck was expelled from the AFL-CIO Executive Council in May. Under pressure, he reversed his previously announced decision to run again for the Teamsters presidency in September. He said he would not be a candidate for re-election.

Hoffa

With Beck out of the running, James R. Hoffa aspired to the Teamsters presidency.

The Senate investigating committee turned its attention to Hoffa. A New York lawyer, John Cye Cheasty, told the committee that Hoffa had hired him to get onto the committee staff and pipe information out to him regarding the committee's investigatory activities. Hoffa was arrested for bribery and was subsequently acquitted.

Sen. McClellan said that Hoffa was on his way to getting "a stranglehold over the Port of New York," through a tie-up with the International Longshoremen's As-

sociation. Hoffa gave partial confirmation, saying he hoped for an all-embracing federation of American transport unions—land, sea and air; his idea was to be in a position to call a strike against all forms of transportation.

Testimony of a former Teamster president in the New York area indicated that Hoffa thought up the idea of creating "paper" locals of the union in New York—locals without any members—in order to swing an election in order to put his man in control. Each local had 6 votes for the union area presidency and 7 were created. The Hoffa man, John O'Rourke, won in 1956.

He did not plead the Fifth Amendment, but Senators criticized him for faulty memory. The committee counsel, Robert F. Kennedy, read the police records of men he said were working for Hoffa in his Detroit headquarters. The list of convictions included crimes such as armed robbery, assault and bookmaking.

Evidence was introduced that Hoffa borrowed from 1952 to 1956 approximately \$120,000 for his outside business activities, much of it from locals of the Teamsters union and from individuals with police records. Usually the transactions were in cash, without notes, interest or collateral.

The main current of the Senate questioning concerned Hoffa's association with Johnny Dio, a New York gangster. Wire-tapped tape recordings of telephone conversations indicated that there was a firm alliance between Hoffa and Dio. At the time, Dio was in prison awaiting sentence on a shake-down conspiracy. He also was under indictment in connection with the blinding of Victor Riesel, labor columnist, by throwing acid in his face.

Dio

At the Senate inquiry, a small Brooklyn machine-shop owner testified that Johnny Dio had used threats against his wife and children to shake him down for \$1,400, demanding that amount for giving him an easy union contract for his 8 employees.

A small manufacturer in New Rochelle, N. Y., told how he had paid Dio \$1,800 in a year to keep his plant from being unionized.

Dio, on the stand before the Senators, invoked the Fifth Amendment 146 times to avoid answering questions on grounds of possible self-incrimination. However, the Senate investigators played a tape recording, wire-tapped by court permission, of a gangland "business conference" conducted over the long-distance phone. The recording, made in 1955, indicated that Dio was part of the labor union network of Hoffa. It bolstered the contention of the

committee that Dio connived in setting up 7 "paper locals" (spurious union units) which helped Hoffa rig a union election in New York.

Feb. 26 Senate opens inquiry into labor-management rackets.

Mar. 13 FBI arrests on bribery charge James R. Hoffa.

18 4 high officers of Teamsters union indicted for contempt of Senate for silence at inquiry.

26 Dave Beck, Teamsters union president, invokes Fifth Amendment at Senate inquiry.

29 Beck suspended by AFL-CIO Executive Council.

May 2 Dave Beck indicted for evading \$56,419 income taxes in 1950.

20 AFL-CIO Executive Council expels Beck.

July 19 James R. Hoffa acquitted of planting spy on Senate rackets committee.

Aug. 8 Wire-taps link gangster Johnny Dio to Teamsters' Hoffa.

15 Dio indicted as \$20,169 income tax evader.

20 Hoffa on stand in Senate inquiry.

28 Dave Beck indicted 2nd time (1st time May 2) as income tax evader. Total taxes alleged evaded 1950-53: approximately \$240,000.

Sept. 25 AFL-CIO executive council gives Teamsters union 30 days to get rid of corrupt leadership influences or face possible expulsion.

25 Hoffa indicted on 5 counts of perjury in New York in connection with testimony he gave in April on alleged wire-tapping in Detroit headquarters.

30 Teamsters convention begins at Miami Beach.

Oct. 4 Teamsters elect Hoffa president by 3-to-1 vote despite threat of expulsion from AFL-CIO.

14 Federal judge in Washington temporarily bars Hoffa from assuming Teamsters presidency.

RUSSIA

ONE DAY AFTER Joseph Stalin died in 1953, the new Premier was announced—Georgi M. Malenkov. There appeared to be 4 men at the top who were potential rivals for power. The other 3 were V. M. Molotov, Foreign Minister, L. P. Beria, head of the secret police, and Marshal Nikolai Bulganin.

Beria was purged and executed within the year, leaving 3.

Almost 2 years after Stalin's death, Malenkov resigned as Premier, professing inadequacy for the post. He was replaced by Bulganin. But there was evidence of the growing power of Nikita S. Khrushchev, who became First Secretary of the Communist Party.

In February, 1956, at the twentieth Congress of the Communist Party, Soviet Union—the first since the death of Stalin—Khrushchev denounced Stalin as a murderer. He decried the "cult of personality"—meaning dictatorship as practiced by Stalin—and said that the Soviet Union was returning to Lenin's principle of "collective leadership."

In the summer of 1957, 3 men regarded as among the most powerful in the Soviet Union were dropped from party and government leadership. They were Molotov, Malenkov and L. M. Kaganovich. The Moscow announcement said they were to receive relatively minor posts. Also dismissed was Dmitri T. Shepilov, who briefly held the post of Foreign Minister.

A party communique accused the 3 most prominent purged men of forming an "anti-party group." The communique went on to say that these men, "now laid bare and fully exposed, have been offering constant opposition, direct or indirect, to this course approved by the twentieth Congress of the CPSU." They were accused of having "manifested a conservative and narrow-minded attitude" and of having "resorted to methods of intrigue and formed a collusion against the Central Committee."

Observers of the Russian scene believed that this newest political purge represented a victory for Khrushchev. They believed that Molotov, Malenkov and Kaganovich had represented in the inner circle the opposition to Khrushchev. In particular, it was believed that they had opposed Khrushchev's policy of decentralizing the Soviet economic set-up so that it would not be ruled in detail from Moscow, but would be divided into regional organizations. Khrushchev's desire to get along more amicably with Marshal Tito of Yugoslavia was regarded as another factor.

1953

Mar. 6 Stalin dies.

7 Malenkov named Premier.

July 10 Beria ousted; executed Dec. 23.

1955

Feb. 8 Malenkov resigns as Premier. Bulganin succeeds him.

1956

Feb. 24 Khrushchev denounces Stalin.
(Speech became known Mar. 20.)

1957

June 29 Communist party's Central Committee ousts from power Molotov, Malenkov and Kaganovich. (Decision revealed July 3.)

ZHUKOV RELIEVED

Was Zhukov upgraded or downgraded? That was the big question throughout the world, on Oct. 26, when the Presidium announced that Georgi K. Zhukov was relieved as Minister of Defense and replaced by Rodion Y. Malinovsky. By the time we went to press, the answer to this question was still unknown.

The shuffling and elimination of Presidium members of the U.S.S.R. is as follows:

Fates of Presidium Members

Number of members since inception	51
Present membership	15
Ousters, demotions	17
Executed	6
Natural deaths	4
Natural deaths: quite questionable	3
Disappearances	3
Assassinated	2
Suicide	1

The life of a Communist leader is, indeed, perilous. On the basis of the score listed before, one wonders whether it is again the story of the ten little indians.

When you read these comments, Zhukov may be the Premier of the U.S.S.R. or on the way to obscurity.

It is not the function or license of an Almanac to speculate on whether Zhukov or other Russian leaders are going up or down. The only thing we are sure of is that the "Red Moon" went up.

RED MOON

(We invite you to read "Man Invades Space" by Willy Ley on page 22.)

SOVIET RUSSIA successfully launched on Oct. 4, 1957, the first earth-satellite, or "baby moon." It whizzed around the globe at 18,000 miles an hour at altitudes from 155-560 miles. Moscow said it took 1 hour, 36 minutes, 2 seconds to circle the earth.

The United States had announced that it intended to try launching a tiny experimental satellite in the autumn of 1957, and a larger version in the spring of 1958.

The world's first man-made moon was described by the Russians as a ball 23 inches in diameter weighing 184 pounds. This was about 8 times heavier than the "moon" the United States was preparing.

The Russians predicted that the earth-satellite would continue its globe-girdling course at least a year.

In the Russian earth-satellite were two radio transmitters which sent signals to the earth. The signals were promptly picked up by the Radio Corporation of America at its powerful listening post at Riverhead, L. I., and identified as 20.005 and 40.002 megacycles.

Russia's moon could be visible only when it reflected the light of the sun at dawn or dusk. Sighting of it was reported from virtually every inhabited part of the earth.

The artificial satellite gave scientists two important pieces of hitherto unavailable information: (1) On the exact shape of the earth, which is known to flatten toward the poles; and (2) The density of the upper atmosphere.

The military implications of the Soviet victory in the so-called moon race were a matter of speculation. The Russians must

have brought to a high stage the creation of rockets. If these rockets could shoot the little ball into space with such precision, it seemed that the same Russian rockets might be able to shoot an intercontinental ballistic missile with a nuclear warhead.

The Russians called their earth-satellite Sputnik.

It turned out that Sputnik was accompanied in its globe-circling course by two additional fellow-travellers. The final part of the three-stage rocket that lofted Sputnik also whizzed around the world as did the protective cone that shielded Sputnik as it was shot through the atmosphere.

Widespread concern was expressed in the U. S. about the fact that the Soviet Union had beaten us in putting up an earth-satellite. Our satellite program was called Project Vanguard. Our proposed "baby moon" would weigh only about 22 pounds as compared to the Russians' 184 pounds. The target date to shoot it into the sky was March, 1958.

President Eisenhower said on Oct. 9 that he saw no reason for "one iota" of increased concern over our national security as the result of Russia's success.

Partly as the result of Sputnik, Prime Minister Harold Macmillan of Britain and President Eisenhower decided at their White House conferences (Oct. 23-25) to stimulate greater scientific cooperation between their two nations. They set up two sub-committees, one to "make recommendations in the field of military defense, particularly those problems dealing with missiles and rocketry," and another to make recommendations "in the field of nuclear relationship and cooperation."

Introduction To Operation News

The Importance of Reading a Newspaper

A NEWSPAPER IS IN A SENSE our contact with the world. News is no longer centered in our own Main Street. Something happens in the remotest part of the world and it flares up in our own cozy living room. For instance:

A governor of a state defies the Federal courts and creates a national crisis. A foreign government shoots an artificial satellite into space and it figuratively lands in everybody's backyard.

In a tense world, the impact of news events is strong. Many of us are frightened, but not for long. After the first shock, most Americans get stirred up, ask questions and speak their minds. This is democracy in action.

Informed citizens are the strength of a nation. Only an informed people can make the necessary right decisions. Time and time again the people have demonstrated that they were better qualified to meet an issue and make a decision than their government.

Take Sputnik, for example. The first reaction was a mixture of fear and frustration. The U.S. was suddenly placed in a position of inferiority to the U.S.S.R. in scientific achievement. Our government was caught flat-footed. Why? Didn't our government have advance information that Russia might launch a satellite? Were our own scientists unprepared to undertake the launching of our own satellite? The answer is apparently No to both questions. High government officials did have advance notice—according to reliable reports, which have not been denied, to my knowledge. They knew as early as March, 1957 that the Russians would launch a satellite about the time it happened. While they knew and did nothing about it, American scientists were pleading with our Department of Defense to rush the launching of our satellite, only to have their pleas rejected. Also, somewhere along the line, some other government official decided we would gain a propaganda advantage with the world if we separated the satellite from any military connection and made it just a nice scientific project. It seems we lost the race to Russia because government officials who were required to make the decisions completely underestimated the whole value of launching a satellite in space.

Besides the advent of Sputnik itself, what put the American people on the alert was the way it was handled by the newspapers. To them it was not just science fiction come true. They evaluated Sputnik correctly and intelligently—they knew its importance and told their readers the whole story honestly. They hit hard and pulled no punches.

What has happened since? Government officials seem to be reversing themselves. They are talking about stepping up our missiles program. The role of our scientists will probably be more important.

As a nation we should develop a healthy respect for our publishers. They and our educators, more than other groups, try to do the job of keeping us informed. If they are not successful, it will be because people do not give them proper recognition and support. One thing should be abundantly clear to us as a great nation: Education is fundamental to a position of power and responsibility.

At the risk of going beyond my role as editor to become an advocate, I would like to make a proposal for providing greater educational opportunities for our children. The cost of education is mounting and the greatest burden rests with the family. Putting a youngster through college costs from \$1,000 to \$2,500 a year. With a number of children in the family, the cost becomes forbidding. Why shouldn't the government allow the family full income tax deduction for the cost of a college education? Where a family's income is insufficient to meet the cost, why shouldn't the government subsidize a college education on a loan basis?

Your support of the newspapers, which are a great force for keeping the country informed, is something you can and should do without too much effort. Simply make the reading of newspapers an important habit for the entire family. Merely glancing at headlines is not adequate for keeping informed—it needs a little more time and effort.

To help you get more out of your newspaper reading, we have designed and developed "Operation News." This section provides you with more background on important news stories, at least, more background than the space of a newspaper generally permits.

We strongly urge you to use our "Operation News" section: check the table of contents on the next page. Here we deal with the most vital questions you will be reading about in the newspapers for many moons to come. We suggest you keep the INFORMATION PLEASE ALMANAC handy when you are reading a newspaper. You will definitely find it helpful.

THREE STAGE LIQUID FUEL ROCKET

STAGES ARE NUMBERED IN THE SEQUENCE OF BURNING

PICTOGRAPH CORPORATION

MAN INVADES SPACE

and

The International Geophysical Year

By

WILLY LEY

IT WAS NOON in Asia, early morning in Europe and late evening in the Western Hemisphere on October 4, 1957, when short-wave sets, for the first time in history, received man-made signals from space. The planet Earth had just acquired another satellite; more precisely, as it turned out later, three of them. The Russians had succeeded in placing the first artificial satellite into an orbit around the earth. The third stage of the three-stage rocket which had thrown the satellite into the orbit was in the orbit too (as was to be expected) and the rocket's nose cone, which had protected the satellite during the ascent through the atmosphere, was also orbiting.

The radio signals, of course, came only from the satellite proper and with their aid the orbital period—which means the time required for completing one circuit around the earth—could be established as being 96 minutes and a few seconds. The orbital period of any satellite, man-made or natural, depends on one factor only, namely its distance from the ground. In other words a wad of newspaper and a locomotive would have the same orbital period if they were orbiting at the same distance from the ground; size, weight or shape are unimportant in *empty* space.

The distance of the satellite was computed at 560 miles. It must be remembered at this point that the Russians, like all Europe (except England) use the metric system and 559.23 miles equal 900 kilometers, a figure which looks as if it had been planned.

The Russian name for their satellite quickly became a household word in the abbreviated form of "Sputnik." The Russians themselves cannot use just this one word alone because it would be too indefinite. It is a regular Russian noun, compounded of *s* (meaning "with"), *put* (meaning "road") and the suffix *nik* which can refer to either a person or an object so that the whole word means "traveling companion." The Russians have to say whose companion it is, hence their term is

Sputnik Zemli, "traveling companion of earth," since *Zemlya* is the Russian word for "earth."

After the news had been spread via radio, television and newspapers most Americans, from senators to odd-job laborers, had the same question in mind. Just what had happened?

Well, this is the International Geophysical Year and among the countless number of research projects two satellite projects had been announced. One was the American Project Vanguard, announced by the White House on July 29, 1955. The other was a Russian satellite project, which was not formally announced by the Russian government the way ours was. A number of months after the American announcement the Russian delegates to IGY conferences simply mentioned their own satellite project. In fact, on several occasions Russian scientists broadly hinted that there would be a "big celebration" of the hundredth anniversary of the birth of the Russian rocket pioneer, Konstantin Eduardovitch Ziolkovsky. This anniversary fell on September 17, 1957. Since Ziolkovsky had been a rocket pioneer the "big celebration" could only be a spectacular rocket shot. An Air Force document released in June, 1957 even stated that a Russian satellite shot would be a likely celebration of Ziolkovsky's birthday and the National Security Council received information about a forthcoming Russian satellite launching in March or April 1957.

American scientists were somewhat annoyed that the firing had not been announced beforehand and said that the secret firing violated the spirit of the International Geophysical Year. The Russian reply to this criticism was that they were not sure that their shot would be successful but that they made their announcement within two hours of the firing, just as soon as they were certain that *Sputnik Zemli* had settled in its orbit.

After the question "what happened" came the second question: "What keeps it up?"

How an Orbit Is Formed

To visualize the way in which an artificial satellite orbits around the earth, it is best to employ a gradual approach by looking at a few rocket trajectories. The German V-2 rocket of World War II covered a horizontal distance of 200 miles. The highest altitude reached by such a rocket along its trajectory was not quite 60 miles at the halfway point. This is a rather curved trajectory. A rocket covering a horizontal distance of, say, 600 miles, might ascend to only 100 miles altitude at the halfway point. A still faster rocket might cover a horizontal distance of 2,000 miles but ascend only 200 miles at the halfway point. It can clearly be seen that the curves grow shallower and shallower the longer the range. At this point we must remember that the surface of the earth is curved too. Therefore there must be a velocity where the curve of the rocket's trajectory becomes as shallow as the curvature of the ground below. This rocket would not return to the ground, provided, of course, that it attains such a shallow trajectory outside the earth's atmosphere. Since the rocket, at that point, will travel on momentum only, there must be nothing which would reduce its momentum, such as air resistance. If nothing is in the way, the trajectory will become a closed curve. And becoming a closed curve, for example a circle, it ceases to be a trajectory. It now acquires a new name—the astronomical designation of orbit.

To stay in an orbit around the earth, a rocket must have a velocity of about $4\frac{1}{2}$ miles per second. When it swings around the earth at that rate, traveling on momentum, the centrifugal force produced is just right to counterbalance the gravitational attraction of the earth.

It is actually the gravitational attraction of the earth which causes the closed orbit. If, as many people used to think, the satellite were "beyond the pull of gravity," it would simply sail off into space along a straight line.

An orbit around the earth can be established anywhere, provided only that it is above the atmosphere. The shape of the orbit will always be elliptical but it is possible in some cases that the ellipse is so "round," or so nearly circular, that the term "circular orbit" can be used. The following discussion has circular or very nearly circular orbits in mind; elliptical orbits will be discussed later.

For all circular orbits, the rule holds true that the artificial satellite, or rather the rocket which carries it and deposits it in the orbit, must move the faster the closer it is to the ground. At sea level, the

speed required would be an even 5 miles per second but, of course, a sea level experiment is impossible because of air resistance. For a distance of about 250 miles the "orbital velocity" has to be about 4.6 miles per second; for a distance of 1,075 miles it is down to 4.4 miles per second. This is so because the pull of the earth's gravity becomes less, as the distance becomes greater. Hence less velocity is needed to counterbalance it and to keep it in the orbit.

On the other hand, it takes more fuel to climb to a farther orbit so that, in terms of fuel expenditure, a "low" orbit is cheaper. In an orbit 240,000 miles from the earth—that is, the orbit of our real moon—the orbital velocity needed is only 0.6 miles per second. But it needs no calculation to realize that it would require more fuel to establish an orbit at such a distance than at a distance of a few hundred miles.

Here is a short table of a few circular orbits:

Distance from ground (miles)	Orbital period (minutes)	Orbital velocity (miles per sec.)
346	96	4.69
470	105	4.41
1,075	120	4.39
3,200	210	3.58
4,000	240	3.47
7,700	420	2.90
22,300	1,440	1.90

The last orbit in this table is called the 24-hour orbit and if an artificial satellite were put into this orbit over the equator it would seem to stand still over one point on the ground since its orbital period and the rotation of the earth coincide.

The problem of producing an artificial satellite is, in essence, rather simple. It must be lifted above the atmosphere and be provided with the necessary (lateral) velocity to stay in an orbit at the altitude to which it has been lifted.

Now what would happen if it had a higher velocity than the proper velocity for the altitude to which it has been lifted? The answer is that it would recede from earth, lose velocity in doing so and would approach earth again; in short its orbit would not be circular, but would be elliptical.

An artificial satellite in a circular orbit outside the earth's atmosphere would be a permanent satellite. A satellite in an elliptical orbit can be a permanent satellite too, provided the whole length of the ellipse is outside the atmosphere. But if

the ellipse, at the point closest to the ground, is still inside the atmosphere the satellite will be a temporary satellite as

we'll see. Both the Russian Sputnik and the planned American Vanguard satellites are, or will be, in such temporary orbits.

How to Shoot for an Orbit

But before we discuss what the orbit is like and what will happen to the satellites we have to look at the problem of how they are brought to the orbit.

The velocity which a rocket can attain depends on two factors, which are technically known as the "exhaust velocity" and the "mass ratio." The term, exhaust velocity, refers to the velocity of the exhaust blast of the rocket motor, measured relative to the rocket. One of the most customary liquid rocket fuels, ethyl alcohol burned with liquid oxygen, produces an exhaust velocity of 7,000 feet per second. This exhaust velocity depends on the energy content of the rocket fuel and most fuels now in use have more or less the same exhaust velocity. The term, mass-ratio, refers to the ratio of the weights of the rocket when fueled and when empty (structure *plus* payload). This ratio is usually between 3 to 1 and 4 to 1, the fully fueled rocket weighing three to four times as much as its empty weight plus payload. To get a very high rocket velocity, both the exhaust velocity and the mass-ratio should be as high as possible. In practice, however, there are limits which have just about been reached by now. The exhaust velocity of the well known fuels

cannot be increased and the development of entirely new fuels takes time.

The mass-ratio can be increased a little as rocket engineers become more practiced and parts grow lighter but nobody believes that this can be pushed very far. However, there is a fairly easy way out: namely the so-called step rocket. If one rocket is carried as the payload of another rocket, this upper rocket, which is called the "upper stage" can reach velocities which no single rocket could attain. The second rocket will reach a velocity as high as about 1.5 miles per second without burning an ounce of its own fuel, simply because that is the velocity to which it is pushed by the first rocket. Then the second rocket, using its own fuel, can accelerate to 3 miles per second. And if there is a third rocket sitting on top of the second this third rocket will start out with 3 miles per second and add whatever velocity it is capable of developing.

With presently known fuels it needs such a three-step rocket to lift a satellite into an orbit. The Russians seem to have used a two-step long-range missile from which they removed the warhead and replaced it with a third stage built for this purpose. The third stage carried the satellite.

Project Vanguard

When the Russians succeeded in launching their satellite, Americans wondered why this country's satellite launching had been delayed.

Project Vanguard, in the beginning, was not Project Vanguard, but was an idea of American rocket scientists who said they could produce a satellite by combining various existing military rockets. After having been turned down once or twice, the idea was finally accepted and discussed under the name of Project Orbiter which was to be a joint Army-Navy venture, with the Army supplying the rockets and the Navy carrying it to the equator to be fired from shipboard. This was in 1954 and 1955.

Meanwhile, Project Vanguard had been suggested as a part of the International Geophysical Year and the Administration felt that an entirely peaceful project would have better propaganda value than a military shot. Therefore Project Orbiter was

discontinued and Project Vanguard announced instead. Vanguard was to use a rocket especially built for this purpose only.

The first stage rocket of Vanguard was assigned to the Martin Company in Baltimore, Md. and the rocket motor for it to the General Electric Co. in Schenectady, N. Y. The second stage was handed to Aerojet-General in Azusa, Calif., and the third stage (a solid fuel rocket) to Hercules Powder. The Naval Research Laboratory was to provide the over-all coordination while the shooting was to take place from Patrick Air Force Base in Florida.

Project Orbiter, if it had been permitted to go on, would have been ready during 1956.

Project Vanguard is also going to use a three-step rocket but here the whole rocket was built for the purpose. A satel-

TAKE-OFF DIAGRAM FOR VANGUARD SATELLITE

lite-carrying rocket can be designed in two ways, which may be called either "from the nose down" or "from the tail up." In the first case, the scientists decide what instruments they want to send into space and find out how much they weigh and how much room they require. That way you get a "payload weight"—21.5 pounds in the case of the Vanguard satellite—and then the three-step rocket capable of carrying this weight into an orbit can be designed. The Vanguard rocket, designed for a rather low payload weight, is a tall rocket (72 feet) but it is not a big rocket, weighing about one ton less than the war-time German V-2.

The Russians followed the opposite procedure of designing from the tail up. They picked the largest reliable rocket missile on hand and then saw how much payload this missile could carry if it was equipped with a third stage and used as a satellite carrier. The weight of Sputnik turned out to be surprisingly high, although the figures given for it by various sources do not agree. The figure of 176 pounds seems to be the most likely if only for the reason that this, in the metric system, would be an even 80 kilograms.

The take-off procedure planned for Van-

guard is the following: the three-step rocket will lift vertically from its firing table at Patrick Air Force Base in Florida. Vertical take-off is the preferred method because the rocket, when it still moves slowly in the first few seconds of its flight, is easiest to stabilize in a vertical position. After a few seconds have elapsed the rocket will tilt itself into a south-easterly direction. The projected take-off trace will go over the Bahama Islands where there are tracking stations for missiles. At the moment the fuel of the first stage gives out, the 3-stage rocket will be 36 miles above ground—or rather the ocean—and 25 miles from the take-off site measured horizontally. A second or two later, the vehicle is no longer a 3-stage rocket, and there are now two rockets in the air. The second stage, still carrying the third stage and the satellite on top of that, has begun to burn and has lifted itself out of the used-up first stage. The first stage continues to travel on momentum, of course, but since it is no longer actively powered, it quickly lags behind the second stage.

The first stage will rise to a maximum height of 65 miles before it begins to fall back. It will fall into the ocean some 230

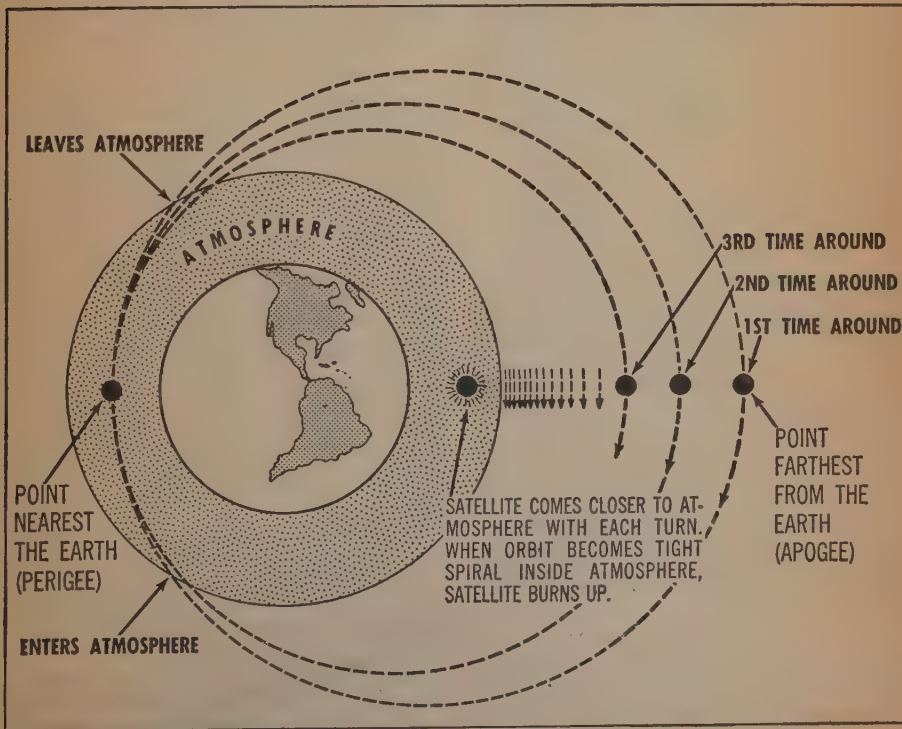

miles from the take-off site. Meantime the second stage has exhausted its fuel; at the moment its motor stopped burning it was 140 miles above sea level and the same number of miles from the take-off site in horizontal distance. But the third stage will not immediately separate from the second stage. The second and third stages together will continue to rise on momentum, gaining altitude but losing some speed in the process. About 10 minutes after take-off, the second and third stages together will be 700 miles from the take-off site and will have reached the highest point of the common trajectory, between 200 and 300 miles above sea level. At that moment the third stage will separate from the second stage. Another 10 minutes later the second stage will splash into the sea, 1,400-1,500 miles from the take-off site, and the third stage will be in an orbit around the earth.

At about that time the satellite will separate from the third stage, but this separation will be very gentle, being accomplished by the release of a tensed spring on which the satellite was mounted.

The Russians must have followed a very similar procedure, although the figures for the heights reached and distances traveled by the various stages are certainly not the same. But while the Vanguard rocket will shed the nose cone protecting the satellite at about the time the second stage begins to burn—the rocket is then so high that the nose cone is no longer needed—the Russians carried theirs into the orbit.

In all cases the various components, meaning third stage and satellite and the nose cone, if any, will at first drift slowly apart but will be in the same orbit for a number of revolutions. Then they will slowly assume different orbits. While it is true that weight and shape make no difference in a permanent orbit well outside the atmosphere this statement does not apply to motion in a temporary orbit. In every elliptical orbit they will pass through two points (see diagram) which form a straight line with the center of the earth. The point nearest the ground is called perigee (from Greek *peri*, meaning "around" and the Greek word *gaia* for "earth") while the point farthest from the ground is called

ORBIT OF A TEMPORARY SATELLITE

apogee (the Greek prefix *apo* means "away from"); for Vanguard, the planned height of the perigee will be 200 miles and the planned height of the apogee 1,600 miles. The air resistance to be expected at perigee will be feeble indeed, but it is there and because it is there a satellite will lose a small fraction of its momentum every time it passes through its perigee. The result of having lost some momentum is that the next apogee point will not be quite as far from the ground as the preceding one. If it was 1,600 miles for the first time it may be 1,599.88 miles the second time and again a little less the third time. This gradual shrinking of the orbit is called the orbital decay.

As distinct from its behavior in empty space, the weight and shape of an object becomes important during this passage through the upper atmosphere. Obviously a solid iron ball would have more momentum than a thin and hollow aluminum sphere of the same diameter. But the loss of momentum is the same each time because both objects have the same diameter. Since the solid iron ball has more momentum at the outset it will last longer in the orbit. Likewise two objects which have the same weight but different shapes would suffer different momentum losses. If the two objects are a burned out cylindrical rocket and a spherical satellite, the rocket, having far more area, will suffer orbital decay faster than the satellite. Since its orbit shrinks faster it will move faster, being on a shorter orbit, and will forge ahead of the satellite as seen from the ground.

As the orbit shrinks it becomes more circular and finally, after one or several years, it will be a circle at the height the perigee then has. It must be mentioned that the perigee also approaches the ground, though at a far lesser rate than the apogee. The circular orbit established at the end of the orbital decay will be entirely in the upper atmosphere. Hence it will immediately decay into a still different orbit, namely a tight spiral along which it sinks deeper and deeper into the atmosphere. When it reaches denser atmospheric layers, still very nearly a vacuum by sea level standards, it will be subjected to heating up because of air resistance. Finally this heat will rise to such a point that the satellite, or the third stage before it, is simply vaporized. This so-called burn-up is going to be a magnificent spectacle if it should take place in the night sky.

The reason why nothing like this happens on the way out is that the three-step rocket builds up its high speed gradually. When it is already more than 20 miles high its speed is still "only" about a mile

per second. This may heat up the skin and especially the nose but not to a dangerous extent. The really high satellite velocities are not attained until the rocket is at the very fringes of the atmosphere. But when the satellite returns it is going at its full speed. Sinking in the earth's gravitational field makes it even increase its speed and when it returns to the 20 mile layer, if it gets down that far, it is going about five times as fast as it did at the same altitude on the way out.

While the satellite is still in space, or rather for as long as its electric batteries will hold out, the instruments will report to the ground what they are built to report. They will count the number of cosmic rays the satellite encounters. They will report by an ingenious method on the number of dust grains which pit its surface. They will report on the earth's magnetic field. They will tell how hot the skin of the satellite becomes while in the sun and how quickly the skin cools off when the satellite enters the shadow of the earth.

As important as the data reported by the instruments are the data from observation of the satellite. The time it takes for the orbit to "decay," the time spent on the spiraling path, and the height at which the satellite finally burns up are all of the highest scientific and practical importance.

Well, if this is the fate of satellites and third stages in a temporary orbit how could one place one in a permanent orbit? There are two possible methods. The perigee altitude of a satellite is the height at which the third stage ceased burning. One can simply put this point so high that it is outside the atmosphere. If the perigee is outside the atmosphere every other point will be safely outside too. Or else one could fire the satellite in such a manner that the perigee is inside the atmosphere but the apogee is safely outside. Then, when the satellite reaches apogee for the first time an additional rocket charge, carried for this purpose, would be ignited. That would start a new orbit in which the perigee is at the height of the apogee of the original orbit (only half of which was actually traversed) and therefore outside the atmosphere along its whole length.

At the moment it is very difficult to decide just how far away the lowest permanent orbit could be placed. The fact that the third stage of the carrier rocket for Sputnik began losing altitude and gaining speed only a week after firing seems to indicate that the resistance is a bit higher than had originally been thought. But, after all, to find out things of this kind is the purpose of the satellite shots,

ROCKET RECORDS TO DATE

Project Farside

During the time which must elapse between writing this and its appearance in print another interesting rocket shot will have taken place. It is called Project Farside and is designed to carry a payload of about three and a half pounds to a height of 4,000 miles, half the diameter of the earth. The rocket assembly to do this is a four stage rocket, put together from existing solid-fuel military rockets. The first stage is what is called a "cluster" of four large solid fuel rockets, the second stage is a single rocket of the same type, the third stage a cluster of four smaller solid-fuel rockets—the type which is otherwise known as the ASP, or Altitude Sounding Projectile—and the fourth a single such rocket. In order to avoid air resistance as far as possible the Farside rocket will be launched from a balloon.

The assembly of solid-fuel rockets will hang, nose up, from a large plastic balloon which will be released and slowly climb to an altitude of from 70,000 to 80,000 feet. It will need several hours to do so. When it is at the peak, unable to climb any higher, more than 90 per cent of the atmosphere will be below it so that the rockets will have very little air resistance to overcome. To simplify the launching problem the rocket will shoot through the balloon. The skin of these large plastic balloons is so thin that the rocket will break it easily. Nor is this procedure wasteful in any way because these balloons can be used only

once, even if you do not shoot rockets through them. The Farside shots will be vertical shots, the various rockets will be left behind and fall down. Since they may scatter over a considerable area, and since the balloon during its climb may have drifted scores of miles, this experiment is performed with the wide Pacific Ocean underneath. It is quite likely that the fourth stage will burn up like a meteorite when it comes back and even the third stage may share this fate.

If the Farside rocket can be provided with one more stage, or else if the four stages are all composed of larger and more powerful rockets than the ones used, the top stage should be able to go all the way to the moon. In passing it may be remarked that this Moon Messenger, as the unmanned rocket to the moon is called in rocket literature, would be too heavy to be lifted by plastic balloons of advertised sizes. But even if larger balloons of this type should not exist it should be possible to build them.

Returning to the satellite programs it is quite certain that there will be a number of pure research satellites, both Russian and American. There might be an effort to fire one of them into a permanent orbit. Another one will probably be fired which will not carry any instrumentation at all but which will have the purpose of producing a very conspicuous object in the sky. This could be done, even if it is not

permitted to weigh more than, say, 20 pounds because of the carrier rockets available, by making the satellite a plastic ball which is colored white or light yellow by a chemical in the plastic or else which is plated with aluminum foil on the inside.

The ball would be carried folded and would be equipped with a tiny pressure cartridge containing compressed air. It should measure at least 25 feet in diameter when inflated. Since the plastic would

not be stretched like a rubber balloon but just be inflated it would retain its shape even if punctured by a meteorite. The air would then escape, of course, but the ball would not collapse because of pressure from the outside since there isn't any such outside pressure in space. If this satellite, which would appear as bright as the evening star, if not brighter, were in a permanent orbit it would be useful for navigational purposes, especially for small ships.

TV Satellites

At a somewhat later date a satellite holding a TV camera would follow. The type of TV show now in commercial use would not be usable for making a "spy in the sky" because of what is called poor resolution. The term simply means that you cannot enlarge the picture much without losing detail. But this poor resolution would be good enough for the purpose for which it has been advocated, which is to follow the movement of the major air masses across the globe and utilize this information for extending weather forecasts.

One use of artificial satellites which might have major commercial possibilities hinges on the existence of the 24-hour orbit which has been mentioned earlier. If one could distribute three TV relay stations evenly spaced in this orbit one could provide TV coverage for most of the inhabited areas of earth. The event to be broadcast would be beamed from the ground to one of these three satellites in the 24-hour orbit. The satellite would beam it back down to the ground in a

wide beam which covers many thousands of square miles. Simultaneously it would beam the same telecast to the other two satellites which would beam it to the ground below them.

This use of artificial satellites is, of course, in the future, but not in the distant future. While it is probable that these relay stations could be made automatic so that the presence of a human being is not required for their functioning there is some doubt whether they could be put into their orbit without a manned ship.

One day a human will have to go into an orbit around the earth, even if only for a fairly short time, say one day, on the first try. The rocket which will carry a human being into space will also have to be a three-stage rocket but of large dimensions since the "payload" will weigh more than a ton. The payload will be a small airplane-shaped rocket ship so that the pilot can land after re-entering the atmosphere.

Man in Space

"Maybe," it has repeatedly been said, "rocket engineers may one day be able to build a rocket which can become a satellite. But you can design the rocket only, you cannot design the man. Man will not be able to stand the trip." Well, engineers have built a rocket that became a satellite and medical experts, while they cannot design the pilot can at least find out whether he would be able to stand the trip. It looks as if he will.

But in order to judge whether a pilot could stand the trip we first have to find out what he will have to undergo. The final speed with which he will move does not matter at all, speed cannot even be felt in frictionless space. But to reach the speed the rocket must accelerate. To understand just what is going to happen and why let us examine the take-off of a large liquid-fuel rocket in some detail and in order to have a measuring device of sorts

we'll assume that inside the rocket there is a spring scale with a one-pound weight bolted to it.

While the rocket stands still on its firing platform, the scale reads 1 pound; but now the rocket motor has been ignited, the fuel pumps are in action and the rocket lifts off. Seen from the outside, it seems to lift rather slowly; during the first second of the take-off it does not even climb its own length. But the velocity of the rocket, at the end of that first second, is 32 feet per second. At the end of the next second the velocity is 64 feet per second. At the end of the third second the velocity is 96 feet per second.

As the rocket begins its rise, the spring scale, which has the 1-pound weight bolted to it, will read 2 pounds. The reason is simple, once you understand the forces involved.

Under the influence of the earth's gravity alone, the scale reads 1 pound. But the acceleration of the rocket going up, due to the steady push of the burning rocket motor, is the same as the acceleration downward which gravity would produce. Therefore, the spring scale reads as if there were 2 pounds of weight resting on it. The force exerted by gravity is usually called *g*. In the rising rocket, the scale behaves as if the force were twice gravity, or 2 *g*, and it actually is, namely 1 *g* due to gravity and another force equal to 1 *g* due to the accelerated motion of the rocket. It is here that a distinction must be made. The spring scale reads 2 *g*, for reasons just explained. This is the "total acceleration" of the rocket. But with respect to the ground the rocket rises as if only 1 *g* were acting on it. The total acceleration is always 1 *g* larger than the "effective acceleration," no matter what the latter may be.

As the rocket continues to rise, moving faster and faster, the spring scale does not continue to read "2 *g*." Slowly the pointer creeps higher and higher. Again the reason is simple. When the rocket was ready for take-off, with all fuel tanks filled to the top, the push of the rocket motor was sufficient to produce that acceleration of 1 *g* "effective." But the rocket motor keeps gulping large quantities of fuel all the time. Hence, while the thrust of the rocket motor remains the same, the weight of the rocket decreases rather fast as the fuel is burned. If the rocket with its fuel weighed 12 tons at take-off and the thrust of the rocket motor was 24 tons, the effective acceleration produced was 1 *g*. After some time the rocket will weigh only 6 tons (6 tons of fuel having been consumed) but the thrust of the motor is still 24 tons. Since less weight is now to be lifted, the acceleration has climbed to 4 effective *g* (with the spring scale inside reading 5 pounds) so that the speed increases four times as fast as it did in the beginning. It is the only known case of a vehicle where not only the speed increases because of acceleration, but the acceleration itself increases, too.

Near the end of the burning time there is, therefore, an "acceleration peak" of as much as 7 or 8 *g* but which lasts for only a few seconds. In a three-stage rocket there would be three acceleration peaks, near the end of the burning period of each

stage. But the total burning time for a rocket going into an orbit would be just about 5 minutes.

After these figures had been calculated the next question was how such acceleration could be simulated on the ground. The answer was a large centrifuge which will fool a man into feeling as acceleration what is actually centrifugal force. Volunteers took the tests, which, incidentally, went farther than just testing for a flight to an orbit. The scientists reasoned as follows: the fastest man will ever have to travel to get into space is 7 miles per second. This is the so-called escape velocity, the speed at which a rocket could escape from earth forever; if a rocket attained this velocity it could go all the way to the moon. It was easy to calculate that a rocket, traveling with an acceleration of 3 *g*, which would make you feel as if you weighed 3 times as much as you actually did, would need 9 minutes and 31 seconds to attain escape velocity.

If the acceleration were higher than 3 *g*, one would, of course, reach escape velocity in a shorter time. The table of alternate choices for reaching escape velocity is:

FINAL VELOCITY: 7 MILES PER SECOND

Acceleration chosen:	Duration of acceleration:
3 <i>g</i>	9 min. 31 sec.
4 <i>g</i>	6 " 21 "
5 <i>g</i>	4 " 45 "
6 <i>g</i>	3 " 48 "
7 <i>g</i>	3 " 10 "
8 <i>g</i>	2 " 40 "
9 <i>g</i>	2 " 20 "
10 <i>g</i>	2 " 6 "

The obvious question was first: could anybody stand any of these accelerations for the necessary time? And secondly: which was easier on the pilot, 3 *g* for 9½ minutes or 7 *g* for 3 minutes and 10 seconds? Volunteers who went through the whole series could report that any one of the choices offered by the table could be endured, but that it was somewhat less strenuous to suffer 4 minutes at 6 *g* than 9½ minutes at 3 *g*.

One volunteer, incidentally, withstood a full 17 *g* for a little more than a minute, a figure which any doctor prior to these tests would have declared fatal without any hesitation.

Zero-G

So there is no need to worry about the health of a pilot for the period the power is on and the spring scale reads high. But how does the spring scale read when the power is off? It does not return to

1 pound, as one may think. It will read: zero. This statement always tends to be surprising at first hearing, but it is really simple. The rocket no longer accelerates, it climbs on momentum. The earth's gravi-

tational pull also fails to register on the scale because the free-coasting rocket does not resist it in any way. Hence there is no force acting on rocket or pilot or scale. In the past this condition was called "free fall," with the word "free" supposed to suggest "free of all strain." But the second word, namely "fall," always suggested a downward movement which was wrong. Hence this term has been abandoned as being unintentionally misleading, and the term "zero-g" has come into use.

How will the pilot's body react to zero-g?

There is no way of producing zero-g on the ground, but it can be imitated for a short time in flight. The method consists of going into a shallow power dive with a fast plane to build up as much speed as possible. Then the pilot pulls out of the

power dive, simultaneously shutting down his engine. This sends the plane into an arc that is traveled on momentum only. For as long as he is in this arc—maximum: half a minute—the pilot experiences zero-g. Quite a number of such tests have been carried out at Randolph Air Force Base in Texas by Dr. Siegfried Gerathewohl and others. The results fall into three very definite classes. The test subjects, Air Force personnel and civilians with varying degrees of flying experience either declared: (a) this is something I won't do again, or (b) I can't say it's pleasant but I can do it if necessary and (c) the most wonderful experience in my life, I can't wait for another flight.

The pioneer space crews would, of course, be selected from the people who make statements like the third one.

Dangers in Space

In addition to strains produced by the flight itself, there are other dangers to people who venture above the atmosphere. The first of these is radiation from the sun. In round figures, sunlight should be about three times as intense at the top of the atmosphere as it is at the atmosphere's bottom. But fortunately none of this radiation can pass through the metal skin of the ship, so that special attention needs to be paid only to the windows which must absorb all the ultraviolet and a good portion of the visible radiation too.

The next danger is the so-called cosmic rays. Cosmic rays are not rays in the usual meaning of the word, but are actually the nuclei of atoms traveling at enormous speeds. Most of these nuclei are those of the hydrogen atom, the lightest and simplest of all atoms. Every once in a while a cosmic ray turns out to be the nucleus of a heavier atom. When such a high-speed atomic nucleus enters the atmosphere, it sooner or later collides with atoms which make up the atmosphere, thereby producing a number of "secondaries." The entering nucleus is logically called the "primary." The term "heavy primaries," which is often used, merely means that the primary was a heavier nucleus than a hydrogen nucleus.

To stop a primary, and especially a heavy primary plus all the secondaries it produces, would require shielding heavy enough to serve in an atomic power plant or as armor on a battleship. And just because of the secondaries which are pro-

duced when a primary collides with matter, a little protection is worse than none at all. As somebody once said (the authorship of this sentence is disputed), "It is like trying to protect yourself from bullets by hiding behind a few layers of window glass." Since protection is impossible, the only alternative is to find out whether a man could brave the cosmic rays he might encounter and survive without harm. The best available information indicates that this is actually possible for a limited period, a few days or maybe even a few weeks. The new anti-radiation drugs may lengthen the "safe" time very appreciably.*

The third danger awaiting man in space is the meteorites. When it comes to meteorites, nothing is as misleading as a visit to a museum which has a good meteorite collection, for example the Hayden Planetarium in New York. There you see meteorites which have been recovered from various places, weighing a ton or two, with some gigantic specimens weighing 8 and 10 and even 13 tons. It is easy to conclude from such a collection that space must be an exceedingly dangerous place, what with 5-ton boulders and 10-ton chunks of iron whizzing around at a rate estimated to be 40 miles per second.

These large meteorites obviously exist, since we have them in our museums, but to conclude that they are common is like believing you can't go for a Sunday's sail offshore without bumping into a whale, fighting off a giant octopus or two and holding assorted sharks at bay. The

* Some cosmic ray research was performed by lifting small animals like hamsters and guinea pigs in airtight cages to 100,000 feet with large plastic balloons and leaving them at these altitudes for many hours. So far nothing more drastic has happened than a few gray and white hairs in the pelts of the animals. The unpigmented hairs are ascribed to cosmic ray impacts, but just how they bleached the hairs is still unknown.

vast majority of all meteorites are what is called dust on the ground. Astronomers have succeeded in making estimates of the number of meteorites which strike the earth. A meteorite half an inch in diameter may seem ridiculously small when compared with the giants in the museum, but to astronomers this is a big one. Well, the estimate says that about 28,000 meteorites of that size or larger strike the earth in 24 hours.

A meteorite 1/100th of an inch in diameter is, of course, a much more common variety than its half-inch brother, and the figure for the number of these which strike the earth during any consecutive 24 hours is correspondingly larger. In the same period of time, 4,500 million meteorites 1/100th of an inch in diameter burn up in the earth's atmosphere. Add to these, 3,000 million meteorites larger than 1/100th of an inch in diameter, which strike the earth daily, and you get a total of 7,500 million hits per day. These enormous figures do sound frightening but we must keep two things in mind: first, most of them are very tiny dust particles; second, the earth is a target nearly 8,000 miles in diameter. When the target is as small as an airplane, the number of hits is reduced proportionately.

For purposes of calculation it was assumed that the rocket has an exposed area of 1,000 square feet. For such a size the expected number of hits by a meteorite 1/100th of an inch in diameter is ridiculously small; the ship is likely to be struck by one every 20,400 hours! This means that 850 days will go by between hits. And the figure even includes all the meteorites larger than 1/100th of an inch. If you go down to particles of 1/100th of a millimeter in diameter—this is about the particle size of very fine silt—you can expect one hit every two hours.

These figures show clearly that a hit from a large meteorite would be so rare that it can be discounted, but that hits of very fine dust particles have to be expected.

If the outer skin of the rocket consisted of sheet steel $\frac{1}{8}$ of an inch thick, it could stop every meteorite up to one millimeter (just about the thickness of a dime) in diameter. But there is a better way, first suggested by Prof. Fred L. Whipple of Harvard. If only a very thin aluminum sheet were placed between the meteorite and the ship's skin, the latter could be much thinner. For at impact velocities up to 40 miles per second, the particle would be vaporized just because it struck something. A portion of the outer shield, probably somewhat larger than the diameter of the dust particle, would disappear too. By perforating the outer skin, the so-called meteor bumper, the power of the impact would be broken so that the ship's skin proper would not be damaged at all. Naturally the meteor bumper would be no protection against a pebble-sized meteorite, but the real worry is the cosmic dust, which is stopped by the meteor bumper.

There is, then, no known reason why a manned vehicle could not go into an orbit. This temporary manned satellite would be the next big step in the conquest of space. It would be a temporary satellite because the pilot of this ship would stay up for only a limited period of time, say 24 hours. Then, by reducing his velocity by firing his rocket motor in the direction of his movement, he would break out of his orbit and enter the atmosphere at a very shallow angle. Even at that shallow angle a final burn-up would threaten an unmanned ship, but here we have a ship controlled by its pilot. If the ship heats up too much, he can escape to higher layers of the atmosphere where there is less air resistance and give his ship a chance to cool off again. It would cool even more effectively if he positioned his ship in such a way that he would be in the shadow of the earth so that the sun's rays do not produce additional heating.

If, prior to breaking out of his orbit, he had jettisoned anything, the jettisoned object would keep orbiting.

The Space Station

This fundamental fact provides the basis for the idea of a space station. Space station also signifies an artificial satellite, but one which is manned. At present the procedure of putting a space station into the sky is visualized as a job with three distinct phases. First the station would be built on the ground and tested thoroughly. Then it would be taken apart to be transported piecemeal to the orbit chosen for it, probably the 2-hour orbit 1,075 miles above sea level. The sections could simply

be left in space and, like the jettisoned object of our example, they would stay there.

Originally it was thought that only one type of rocketship would be used throughout the whole space-station program. This rocketship was supposed to carry up the space station piecemeal, then to bring the assembly crew (the same people who had disassembled it on the ground) and later on the crew for the station, and finally to serve as a supply ship for the

station, including the carrying of relief crews. To concentrate on one type of rocketship only seemed to be the most practical solution. But a recalculation of the whole problem from the point of view of fuel economy suggests that two types of ships would be better, the second type being an unmanned freight carrier. Of course it would simply be impossible to direct an unmanned freight carrier to a certain point of a certain orbit at a specific moment by remote control from the ground. But the problem changes radically if a manned ship is waiting in the orbit to take over control from the ground station as soon as the freight carrier has left the atmosphere.

The third phase of the job would be the reassembly of the station, performed by men wearing space suits designed especially for this purpose. Prototypes of such space suits are already in existence.

The space station is not in the immediate future like the artificial satellites. At best ten years will go by between the first satellite shot and the assembly of the space station. But it will be something well worth having. The main concern of the space station will be the earth. Just as one can get a better view of a landscape from an airplane than from horseback, from the space station one could get an excellent view of the earth as a whole and, with proper optical instruments, of fine detail when necessary. At any one moment, nearly half the earth would be visible to the space station; and within a 24-hour period, every point could be inspected at least once while it was daylight for that point.

This visual inspection of the ground from the space station, far superior to inspection by means of remotely controlled television, naturally has its military implications. On the peaceful side no iceberg could approach the shipping lanes and no ship would get into distress unnoticed. On the military side no fleet maneuver could take place without being observed in detail. On the peaceful side no airliner, after an emergency landing, would be out of touch with the space station. A two-way conversation with the space station by radio on a 3-centimeter short wave needs surprisingly little power, a set powered by three flashlight batteries could do it. On the military side it would be easy to count the number of jet bombers taking off from an air base and contrary to Mr. Khrushchev's pronouncement the long range missile has not made the long range bomber obsolete. It is acknowledged military experience over the last century that new weapons are always additions to the arsenal but that they very rarely make an existent weapon wholly obsolete.

From the military point of view, the space station would be the most efficient kind of open-sky inspection we can imagine. It could also be a weapon by acting as a guidance system for long range missiles fired from one point to the ground to another point on the ground. To bring the missiles up to the station might not be economical because of the large amount of fuel required to bring something to the station, namely about 140 pounds of fuel for every pound of payload that gets there.

Whether the space station itself would be vulnerable to guided missiles, or rather how vulnerable it would be, is at present much discussed among experts. The question is mainly how well the space station could defend itself against missiles fired at it from the ground.

There is no doubt, however, about its value for such peaceful purposes as have been mentioned and for a few others. The station, being outside the annoying haze of the earth's atmosphere, would be an astronomical observatory of almost infinite capacity. Most of the astronomical puzzles of today could be solved within a short time with a photographic telescope operated from the space station. (It is only in the nature of things that the space station would discover a new set of astronomical puzzles which it could *not* solve.)

The space station would be an entirely novel research laboratory, a laboratory where the sun would be willing to heat any substance to any degree of heat without any charge at all, where a substance could be cooled off to very nearly absolute zero simply by placing it in the shadow of the space station. It would be a laboratory where cubic miles of vacuum would be accessible to anybody interested in vacuum techniques. It would be a laboratory where the growth of crystals and living cells at zero-*g* could be studied. It would probably pay for itself within a few years.

Finally, the space station would be the base of operations for the assembly of the deep space ships for exploration of the moon and the neighboring planets. Like the space station itself these ships would be built on the ground, disassembled and carried piecemeal into the orbit to be reassembled and fueled there. A manned flight around the moon, without an attempt at landing, would be man's first trip into the space beyond the orbits around the earth. This might be done almost at once after the space station is finished. A flight to the moon with landing could follow a very few years later. And then the expeditions to the nearest planets can be planned. We can be certain that Man will set foot on the neighboring planets within a few decades.

The International Geophysical Year

THE SATELLITE SHOTS which open the door to space, are technically just a part in a more comprehensive scientific venture known as the International Geophysical Year, or IGY. It began on July, 1957 and will run to the end of 1958. The "year" has an extra six months, partly to permit leeway for getting started and partly for the purpose of observing through overlapping seasons.

The purpose of the IGY is nothing less than the investigation of the planet Earth. As Earth is inhabited by many nations, IGY becomes an international job in which many countries participate—64, to be exact. Where IGY is concerned, the Iron Curtain hardly exists, the Russians are as interested in what is going on in the Arctic Ocean, say, as are Canadians, Americans and Norwegians and they can find out only by collaborating.

The total manpower of the IGY is about 8000 scientists, from astronomers to zoologists. The total expense is estimated to be one half billion dollars, shared by the governments of participating countries.

Dozens of modern research vessels are traveling the seven seas for making observations, hundreds of high altitude instrument-carrying research rockets have been prepared; several hundred vantage points for observations have been scattered all over the globe. Airplanes have hundreds of flights to carry men and equipment to these vantage points.

Like everything else, the IGY is a concept which grew slowly and it is not even the first instance of such international collaboration for scientific purposes. During the last century there was such an effort to explore the Arctic regions. It was called the Polar Year (actually it was a North Polar Year) and it took place in 1882. Fifty years later the nations again got together on a Second Polar Year (1932) was mostly devoted to the Antarctic Regions of which little was known. When the second World War was over scientific circles began to wonder whether it might not be useful to have another such "year" on the 25th anniversary of the Second Polar Year. Because it had to be an international venture, the matter was discussed through the International Council of Scientific Unions. Because of the great progress made in various fields, especially in the field of air transportation, it was decided that the new "year" should not be devoted to an area, like the Arctic or the Antarctic, but to the planet Earth as a whole. In 1952 the International Council set up a special planning organization, the *Comité Spécial de l'Année Géophysique Internationale*, abbreviated as CSAGI.

In every nation there exists a scientific body which is a member of the International Council of Scientific Unions. In the United States this body is the National Academy of Sciences. The National Academy first had to secure the participation of its own government (as did the equivalents of our National Academy in their respective countries) and then had to figure out what the United States could or should do. For this purpose a national planning organization was established, the National Committee for the International Geophysical Year. The various national committees, through CSAGI, then informed each other what they planned to do and these plans were coordinated. It goes without saying that the various countries, like individual scientists, have their specialties. The Danes, for example, excel in the checking of ocean currents and fish migrations. The geographic location of a country also plays a rôle, thus most of the work on the Arctic Ocean has been split between the Russians and the Canadians. On the other hand, many nations are interested in Antarctica so that the Antarctic Continent is dotted with a most international assembly of observing stations.

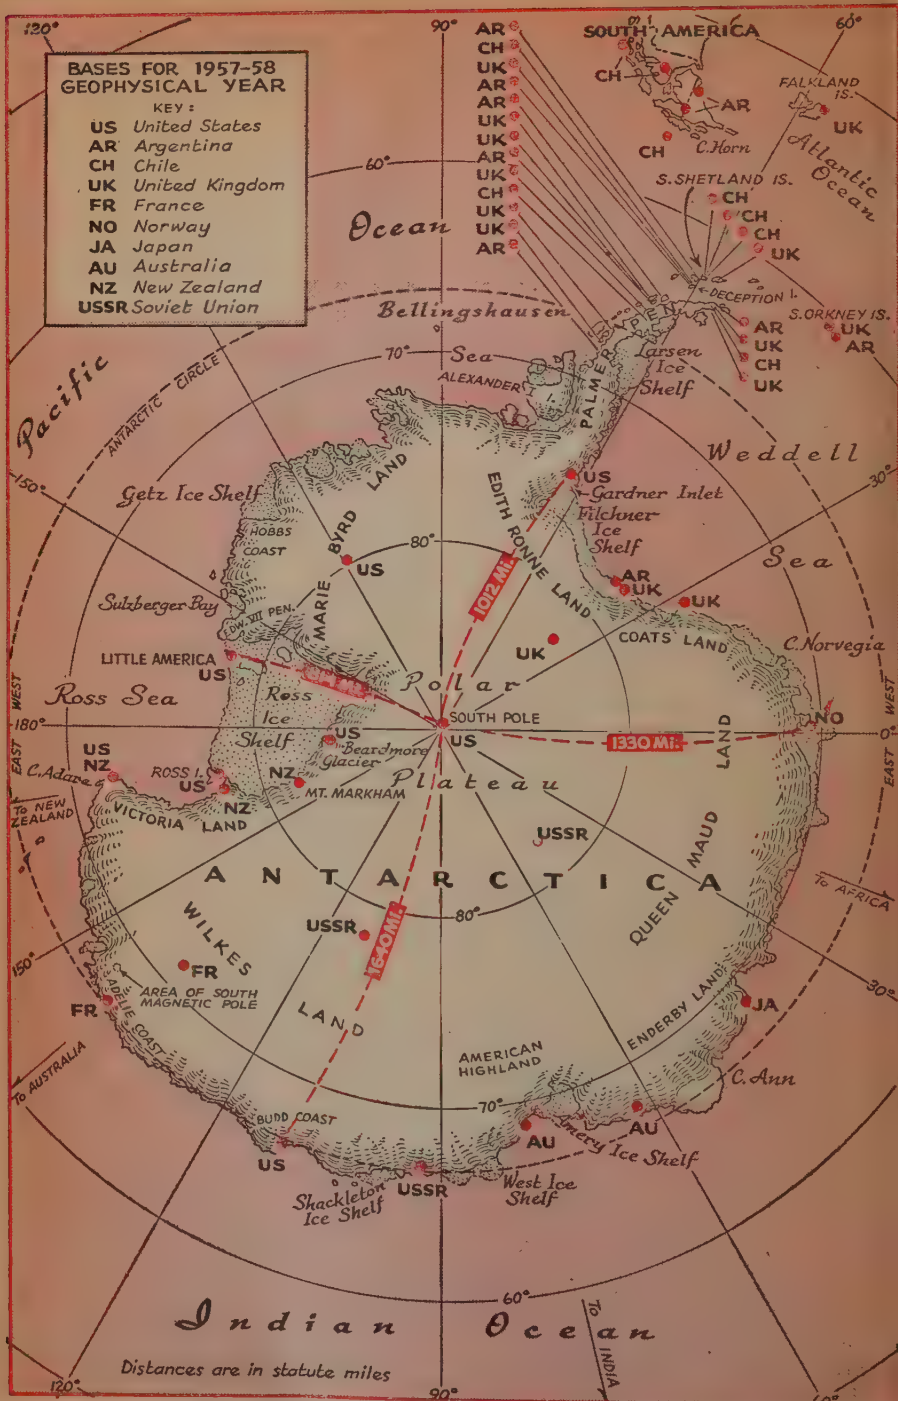

While every nation does what it can do best—cross-checking results with other nations—there is a schedule of so-called World Days. There are many natural events which should be observed from many different places simultaneously. For example, a meteorologist who would like to construct a world weather map will be incapable of accomplishing his task if he gets a weather report from Central Asia for the 10th of December, the Australian report for the 15th, the United States report for the 20th and reports from the high seas for all the dates in between. He needs reports from all over for the same date and, if at all possible, for the same hour. So six ten-day periods have been chosen to be World Meteorological Intervals, during these periods all stations will make intense weather studies. (The Periods are: Sept. 18–27 and December 12–21 in 1957; March 17–26, June 15–24, September 13–22 and December 12–21 in 1958.) Roughly three days in every month have been designated as Regular World Days; these days have been chosen because of predictable events, like days of the new moon, nights where meteors can be expected or days on which eclipses of the sun will take place (April 19 and October 10, 1958). These days will see intense studies of the events that take place, in addition to the routine work of the various stations.

The scientific value of the IGY lies mainly in the fact that the same natural

JA Japan
AU Australia
NZ New Zealand
USSR Soviet Union

event can be observed simultaneously from various places which are many thousands of miles apart.

One of the discoveries which the IGY has already brought (but not yet explained) is a mysterious rise of the water of the Arctic Ocean. Fourteen stations are concerned, among other things, with sea level changes in that ocean. Of these stations seven are Canadian, four are Russian, with one each from the United States, Icelandic and Finnish. The researchers on the American end found that there is a rise of a few inches which cannot be accounted for by tides or storms or other known factors. It happened at regular intervals of about four days. The researchers then checked with the Russians, they had observed it too.

If you ask just what the IGY scientists are after the answer is easy. It is "everything." It begins at the bottom of the ocean. Is the bottom water of the ocean warmed a bit by the hot interior of the earth? A device has been designed which may help us to find out. Furthermore: are there currents at the bottom of the ocean? We don't know any, but there are reasons for assuming that there must be. The IGY scientists will find out. Are there currents in the ocean at intermediate levels, say 500 fathoms down? We don't know but the IGY will try to find out. The surface currents, which are known, are being re-checked and re-mapped by ships belonging to ten different nations.

The land itself is the next thing to be investigated. Scientists are checking on the gravitational attraction of the earth in many places, they keep an eye on volcanoes and earthquake zones, they are especially concerned with the age of glaciers and the ice on both poles. Nobody knows right now, for example, how much ice there is on earth. In fact we do not know whether the Antarctic Continent is actually a continent which is iced over or whether it is two continents plus a number of islands which only seem to be a single continent because of a common ice cover. After the IGY is over we'll know.

We will also have a good idea of just when the ice of the poles and of the larger glaciers formed and we might be able to predict a general climatic trend because of this knowledge.

The next thing to be studied is the atmosphere. The lower atmosphere, technically known as the troposphere, is the layer near the ground in which all the events take place which we call by the name of "weather." A thorough and planet-wide study of weather will result in improved forecasts which may save whole crops of whole countries and areas. With perfect weather knowledge, we'll also be able to predict floods in advance.

The higher layers of the atmosphere are the stratosphere, about which we want to know more because future air transport may take place in the lower stratosphere to a large extent. And although the stratosphere—from 10 to 40 miles altitude—does not have any "weather" in the customary sense of the word except for high winds, it is possible that the stratosphere does influence the weather below in the troposphere. It is worth some effort to find out. Above the stratosphere there is another very tenuous layer which is called the ionosphere. It has its name from layers of so-called "ionized gas" which are caused by the sun's radiation. These ionized layers are of great practical importance because they act like mirrors to radio waves and long distance radio communication is based on the existence of these layers. Naturally we want to know all about them that can be known.

The various projects of the IGY will not all be concluded on the same day, the ocean researchers are already considering extending their activities for another six months into 1959. And the satellites, because of the slow rate of orbital decay, will still be in space many years after the IGY has officially closed. But at the end of the IGY we will know much more about our planet than we do now and much of the new information will produce useful results soon.

EDITOR'S NOTE

If, during your reading of Professor Ley's article, you were conscious of having read some of the material before, your recall is quite correct. Our 1957 edition included another article by Professor Ley, "Jets—Rockets—Missiles."

This article contained an excellent description of sending an artificial satellite into space. We felt that the material was so timely and interesting that we asked Professor Ley to repeat and bring up to date this material for your benefit and the benefit of our new readers.

THE MIDDLE EAST IN FERMENT

By J. C. HUREWITZ

THE DAWN OF 1957 found an unprepared United States saddled with primary responsibility for the defense of Western interests in the Middle East, an area that stretches from Egypt and the Sudan in northeast Africa to the eastern frontiers of Iran in non-Soviet southwest Asia. As recently as World War II the Middle East still lay securely within the Western—chiefly British—orbit. The swift decline of British power since then, however, has coincided with the menacing rise of Soviet interest and influence in the region, particularly in the Arab sector.

A glance at the map will readily disclose the strategic centrality of the Middle East for American security planners. Lying at the juncture of three continents, the Middle East can function either as a bridge or a barrier in international communications. This was dramatically demonstrated by the blockage of the Suez Canal for nearly half a year in the crisis of 1956-57. From its opening in November 1869 to October 1956 the canal served as the principal transportation artery between Europe and Asia and Africa. Indeed, it became the world's most heavily traveled sea lane by 1956, when in the first nine months an estimated 15 per cent of the total international ocean-going traffic passed through the man-made ditch.

Through the Suez Canal have been funneled chiefly raw materials from Asia and Africa and finished products from Western Europe. Crude oil, most of it destined for our trans-Atlantic allies, accounted for nearly two-thirds of the Suez shipping. Petroleum grew steadily in importance as a source of energy in postwar Western Europe and by 1955 furnished some 18 per cent of its overall energy needs. Three-fourths of this oil was imported from the Middle East. Thus not only the military establishments of the NATO community in Europe but an ever-widening segment of its basic industry depended on Middle East oil.

Oil Reserves

Middle East petroleum production rose from 8.1 per cent of the non-Soviet world's

total in 1945 to more than 20 per cent eleven years later. Of even greater significance, the estimated oil reserves in the region multiplied in the same period from 19 billion barrels or 38 per cent of the non-Soviet world's total to 144.4 billion or well over 70 per cent, as contrasted with the estimated 35 billion for the United States. Virtually all Middle East oil is being developed by companies of Western nationality, which by the end of 1955 had invested approximately \$2.75 billion in fixed capital assets. Of this sum about \$1.29 billion or nearly one-half represented investment by United States companies, whose share of the estimated reserves under prevailing concessions approached 60 per cent of the regional total. Most impressive were the direct revenues accruing to the participating Middle East governments, which in 1956—despite the post-Suez cutbacks—received \$940 million as their half share of the net profits, in contrast to \$880 million in 1955.

The major producing fields lie in countries adjacent to the Persian Gulf, four-fifths of the established reserves concentrated in Arab lands. Non-Arab Iran, the principal producing state in the region before the Anglo-Iranian oil dispute (1951-54), recovered quickly after the settlement so that by June 1957 it was exporting 731,000 b/d or some 90,000 b/d more than on the eve of the crisis. But Iran ranked third after Kuwait and Saudi Arabia, each of which exported more than one million b/d. Moreover, in the Arab East are located not only the Suez Canal but pipeline systems that crisscross Jordan, Syria and Lebanon.

What happens in and to Arab lands has thus become of manifest concern to the United States. Involved are problems of protecting American private investment and of fueling the NATO machine, the kingpin of the elaborate collective security system that the West has devised in defense against an expansive Soviet Union. This helps explain why the United States has not framed a viable policy toward the Arab-Israel area.

THE ARAB-ISRAEL DISPUTE

Sympathy toward Israel has run deep in the United States. The feeling of friendship is compounded of humanitarianism in support of the European Jews uprooted by the Nazis in World War II, of respect

for the nascent state's military stamina against overwhelming numerical odds, of the Israelis' ingenuity in organizing available technical skills for the rational exploitation of their country's niggardly

natural resources, and of the pro-Western orientation of the Israel government and a massive majority of the Israel public.

At the same time the United States has given its blessings to national self-determination throughout the Arab East and has been generous in its offer of economic and technical assistance to the newly sovereign Arab states, encouraging them to launch comprehensive development programs. Pro-Arab sentiment is widespread in the United States among missionaries whose churches have served Arab lands for well over a century, among those who have invested in the oil industry and other business ventures in the Arab East, and many who have been disturbed by the lingering phenomenon of an Arab refugee population.

The displaced Palestine Arabs, whose number because of internal growth is pushing toward a million, forms only one of the legacies of the Arab-Israel war of 1948. From its birth a decade ago Israel has carried on without permanent boundaries. Originally created under United Nations auspices as a provisional expedient to terminate the hostilities, the armistice system has been progressively breaking down. The city of Jerusalem, which many hoped might be placed under an international regime, remains more divided than ever. Having failed to defeat Israel on the field of battle, the Arab League has sought to strangle their hated neighbor through economic blockade.

Favors with Each Hand

In this context the United States practice of distributing favors alternately to

the two antagonists has elicited little approval from either party. Most Arab nationalists are persuaded that the United States is incurably pro-Israel, a conviction that cannot be shaken short of full endorsement of their hopes of eliminating the new state altogether. In their eyes, Israel is America's spoiled child and is kept alive artificially through America's mistaken generosity. The Israelis for their part tend to accuse the United States of over-indulging Arab nationalist extremism and of thereby delaying a formal peace settlement.

The reasons for United States pussy-footing are clear enough. The possession of strategic real estate and of oil gives the Arabs diplomatic advantages in a period of world tension. Washington therefore has been prone to show greater patience with the Arabs and to attempt placing Israel in cold storage. Yet the United States is far from ready to sell Israel down the Jordan. Rather it is argued that the avowed American policy of "friendly impartiality" is designed ultimately to lead the disputants to an accommodated settlement.

The American and Soviet tactics after 1955 of competing to arm the Arab states, while withholding modern weapons from Israel, has symptomized the renewal and intensification of the cold war in the Middle East. It has already contributed to the explosion in Sinai in the fall of 1956 and, with the quickening of Soviet-American rivalry in the summer of 1957, seemed to be laying the ground for fresh outbreaks.

ARAB UNITY NATIONALISM

Arab nationalism is essentially a twentieth-century phenomenon. Admittedly, nationalism came to Egypt as early as the 1870's. But that was Egyptian, not Arab, nationalism. Indeed, Egyptians did not identify themselves in the nationalist sense with the rest of the Arab world until the late 1930's, when the Palestine problem began to provide a political focus for Arab nationalists everywhere. Even then the identification, official and public, spread slowly.

The hatred engendered against Zionism and Israel in the years following merely constituted the most extreme expression of a general sense of disillusionment in Europe that bred anger and hostility. Arab outrage, primarily in the Fertile Crescent, was itself a product of the

relatively brief experience with British and French mandatory rule after World War I. Arab nationalists viewed Zionism and Israel as an unwarranted intrusion and a beachhead, not of democracy, but of European imperialism. And because Israel was located in the Fertile Crescent, these emotions mingled with the obsessive preoccupation with schemes for Arab unity that abounded in that particular area.

Nor is it surprising that the Arab League, the one unity project that saw the light, served from the outset as an agency of Egyptian foreign policy. The most populous Arab country, Egypt, became the nub of Arab cultural life, providing leadership in religion, education, the professions and, most recently, military organization.

Mr. Arab Unity

The military *junta* that overthrew the dynasty in 1952 launched a comprehensive revolution in the internal life of Egypt but preserved intact the essential features of the *ancien régime's* external Arab policy. Under the aegis of the youthful army officers, the policy prospered as never before. Radio Cairo became a potent force from one end of the Arab world to the other and played a major role in building Gamal 'Abd al-Nasir as the symbol of Arab unity.

'Abd al-Nasir's meteoric rise to fame in the Arab East started with his signing in September 1955 of an arms deal with

Czechoslovakia and the U.S.S.R. and reached its peak with the nationalization in July 1956 of the Suez Canal Company. What particularly endeared the Egyptian president to the Arab masses was his seeming ability to stand up and trade body blows with the great powers of the West. The military debacle in Sinai in the fall of 1956 and the absence of new grand gestures of defiance in subsequent months checked, for the time being at least, the further growth of 'Abd al-Nasir's popularity. Still the elaborate propaganda machinery of the Egyptian military regime worked round the clock to keep alive the image of 'Abd al-Nasir as "Mr. Arab Unity."

THE BAGHDAD PACT

The British surrender in October 1954 of the massive, versatile base in the Suez Canal zone marked the culmination of a process of British military contraction in the Middle East that had begun with the evacuation in 1946 of wartime garrisons in Syria and Lebanon, withdrawal in 1947 from Cairo and Alexandria, and the abandonment to chaos in 1948 of the Palestine mandate. The piecemeal dismantling of the British military system conformed to post-war realities. Imperialism had become outmoded in the West, and the depleted British exchequer could no longer afford farflung bases in the face of mounting costs.

But the headlong decline of British power deprived the West of a means—tested and proved in World War II—of safeguarding its regional interests and of integrating the Middle East into its global military arrangements. Efforts were therefore made in 1951–52 to establish a comprehensive collective security system for the Middle East with the local states and the Western powers participating on an equal basis. But these efforts failed because the Arab states in particular did not share the West's desire to contain Soviet aggression. The Arab governments instead tended to view Britain and France as the aggressors because of their continued controls in various parts of the Arab world.

Secretary of State John Foster Dulles then sought in 1953 to apply the collective security principle to the Middle East on a segmental basis, on the theory that "the northern tier of nations" along the Soviet frontier were sensitized to the "common danger."

U. S. Encourages Pact

With American encouragement and assistance, Turkey, Iran, Pakistan and one Arab country, Iraq, joined Britain in 1955 to form a multilateral security system that came to be known as the Baghdad Pact. But the very creation of the organization, which was designed to circumvent the resistance of the remaining Middle East states and their immediate neighbors to collaboration with the West, merely made those states—notably India, Afghanistan, Syria and Egypt—predisposed to accept favors from the U.S.S.R. and intensified the tensions in the Arab-Israel area.

The United States did not join the pact as a full member but merely agreed to sit on its economic and countersubversion committees and, after the Suez crisis, on its military committee as well. This straddling of the issue deprived the organization of military effectiveness and exposed the United States to criticism as much from the adherents of the pact as from its enemies.

SOVIET INTERVENTION

The Baghdad Pact provided the Russians with a long-sought opportunity for meddling in the affairs of the Middle East. If we are to understand Russia's actions in the Middle East we must keep in mind the Kremlin's obsessive anxiety over "capitalist encirclement." The apprehension over the Middle East frontier, where no

submissive zone separates the U.S.S.R. from the outside world, is perhaps greater today than anywhere else along the Soviet periphery. The Middle East adjoins vulnerable districts of the U.S.S.R., where essential industries and raw materials are concentrated.

Immediately after World War II the Kremlin tried, as in Eastern Europe, to dismember Iran and convert Turkey into a satellite. Stopped in their tracks by the determined Western stand, within the United Nations and beyond, the Russians lost initiative in the Middle East for nearly a decade. Nevertheless Moscow supported every move that relieved Britain and France of their bases, influence and interests in the region and that prevented the U.S. from becoming involved in the Middle East in any way, shape or manner.

Turned Back on Israel

Because of the absence of Soviet political treaties, formal military commitments and direct commercial investments, the Russians could afford to be totally unrepresed in their dealing with Middle East countries and reversed their policies at will. This was amply demonstrated in the Arab-Israel zone. The U.S.S.R. championed the cause of Israel in 1947-49 politically by undeviating support at the United Nations and materially by permitting the sale of Czech arms to the fledgling state. Since 1953 the Russians have endorsed the Arab position at the United Nations without qualification as part of a deliberate bid for Arab nationalist favor.

The Russians finally scored a diplomatic breakthrough to the strategic nerve center of the Middle East, when Egypt, with Syria in tow, consented in 1955 to accept Soviet orbit arms. As the most vocal exponents of Arab unity, Egypt and Syria were no less dedicated than the Russians to the proposition of cleansing the Arab East of all residual Western interests. Thus Arab nationalist, and not communist, regimes were conducting pro-Soviet policies under the slogan of "positive neutralism" and carrying with them all Arab unity nationalists. And the Soviets for the first time were in the comfortable position of being able to direct their anti-Western operations in the Middle East by remote control. It was ironical that the U.S.S.R., which alone among the Great Powers engaged in imperialist expansion since 1945 and, unlike Britain and France, surrendered no territories wrested from Middle East peoples in an earlier period, should be able to sell itself in the region, particularly in the Arab sector, as the supreme advocate of anti-imperialism. Yet the United States, with no territorial ambitions—past or present—in the Middle East, seemed hardly able to take any counteraction without inviting accusations of imperialist interference.

THE EISENHOWER DOCTRINE

Prior to the Suez crisis of 1956 the United States tried with diminishing success to coordinate its Middle East policies with those of Britain and France and tended, in general, to rely on the military power of the United Kingdom in the region. Though accepting more and more financial commitments, the United States nevertheless continued reluctant to undertake military responsibilities. But the determined stand taken by Washington, within the United Nations, and beyond, against the British and French military action in Egypt destroyed the principle of coordination and in fact so weakened the prestige of the United Kingdom in the Middle East, that the United States had to move into the breach, if any Western interests were to be salvaged.

Warning to Russia

The doctrine promulgated by President Eisenhower on January 5, 1957 and approved by the Congress two months later, was designed to warn Russia and the states of the Middle East that the United States would prevent, by the use of American troops if need be, any segment of the region from falling behind the Iron Curtain. Moreover, to avoid the stigma of

imperialism that the nationalists were bound to attach to any unilateral declaration by the United States, the doctrine made it clear that American action would be taken only by invitation from a Middle East state and that American policy would be developed in partnership with the countries of the region.

But the fact remained that the immediate menace to the Western position in the Middle East did not come directly from "international communism" or Soviet aggression. Instead, it came from Arab unity nationalism under the leadership of Egypt and Syria, aided and abetted by the Soviet Union. For dealing with this kind of threat the Eisenhower doctrine furnished no adequate techniques.

Arabs Close Ranks

Furthermore, the attempts by the United States to woo Saudi Arabia, Jordan and Lebanon away from the influence of Egypt and Syria seemed likely to founder on the rock of the unresolved problems of the Arab East. When the British went to the aid of the Sultan of Muscat against the refractory Imam of Oman in mid-summer of 1957, all Arab states closed ranks. An even more dramatic demonstra-

tion of Arab solidarity was given the world at the United Nations General Assembly in the fall, when all Arab friends of the United States unreservedly endorsed Syria's anti-American position.

Thus, it appeared late in 1957 that the Eisenhower Doctrine, though a step in the right direction, hardly came to grips with

the problem. The United States was still urgently confronted with the need to find more effective means of dealing with the basic issues of the Middle East. For otherwise it was not beyond the realm of possibility that the region with its invaluable oil deposits, military bases and intercontinental communications might be lost to the West.

CHRONOLOGY OF THE MIDDLE EAST CRISIS

Suez

- 1956
- July 19 U. S. withdraws its offer to help Egypt build Aswan dam on Nile.
- 26 Egypt announces seizure of Suez Canal control.
- Aug. 21 18 nations at London conference accept Big 3 plan for international control of Suez Canal; Russia, India, Indonesia and Ceylon balk.
- Oct. 1 Suez Canal Users' Association is launched in London; 15 nations join.
- 13 Russia vetoes U. N. Security Council resolution proposing international control of Suez Canal.
- 29 Israel launches attack on Sinai Peninsula and drives toward Suez Canal.
- 30 Britain and France send 12-hour ultimatum, demanding right to put troops in Suez Canal Zone. Egypt rejects it.
- 30 Britain and France veto Security Council cease-fire resolutions.
- 31 French and British planes bomb Egyptian airfields.
- Nov. 2 Israel claims control of Sinai Peninsula and Gaza Strip in quick military victory over Egypt.
- Nov. 5 U. N. Assembly votes to organize U. N. police force to restore peace to Egypt.
- 5 British and French invade Egypt at Port Said.
- 5 Russia announces it is prepared to use force to "crush the aggressors and restore peace" in Egypt.
- 6 British and French cease fire at Port Said and halt their Suez advance.
- Dec. 28 U. N. salvage fleet begins clearing Suez Canal of its sunken ships.

1957

- Jan. 15 Egypt announces seizure of British and French banks.
- 30 Eisenhower welcomes King Saud of Saudi Arabia in hope of improving U. S. Middle East relations.
- Feb. 11 U. S. offers Israel pledges on Aqaba and Gaza if it will withdraw troops.
- Mar. 4 Israel orders its troops out of Aqaba and Gaza despite protest demonstrations.
- 6-8 U. N. troops take over Gaza Strip and at Gulf of Aqaba to neutralize areas sought by Israel and Egypt.
- Apr. 9 Ships move through Suez Canal after U. N. salvage operation.
- 24 Egypt gives U. N. its plan for exclusively Egyptian operation of Suez Canal; U. N. reluctantly accepts it (April 26) on trial basis.
- July 22 Indonesia announces it will withdraw its contingent from Aqaba and Gaza, first nation to do so. This leaves slightly under 6,000 U. N. troops on patrol to keep peace.

Jordan

1957

- Apr. 14 King Hussein of Jordan ousts pro-Communists (and pro-Egyptians) from government.
- 25 U. S. orders 6th Fleet to Middle East waters as King Hussein orders martial law to forestall Communist coup.
- May 3 U. S. 6th Fleet recalled as Jordan remains calm under Hussein.

Oman

1957

- July 20 The Imam of Oman, a religious leader, leads revolt against the Sultan of Muscat and Oman on the tip of the Arabian Peninsula.

- nism and threat to neighbor
countries.

Syria

- 7 Eisenhower warns Russia not to push Syria into Middle East aggression.

- 9 U. S. planes fly emergency shipment of arms into Jordan.
 - 13 Russia accuses Turkey of massing troops on Syrian border; warns of world war peril.
 - 27 King Saud of Saudi Arabia ends 3-day visit to Damascus and says Syria "cannot in any way constitute a danger to its neighbors."
- Oct. 13 Egypt sends troops to northern Syria to reinforce region bordering Turkey.

ARMS AND DISARMAMENT

By GEORGE FIELDING ELIOT

MAN'S NATURE, unlike his weapons, remains unchanged.

The solution of the problem of disarmament continues to depend on satisfying one of two requirements—confidence or safeguards.

As of today, confidence does not exist between the free world and the Communist world, nor does there seem much prospect that it will come into existence at any early date. There remains, therefore, only the hope of establishing safeguards mutually acceptable to all parties concerned.

It is to this problem that the Disarmament Commission of the United Nations has been addressing itself for the past five years, ever since January 1952 when it took over the task previously attempted by the Atomic Energy Committee. Much of the work has fallen upon a subcommittee consisting of the U. S., Britain, France, Canada and the Soviet Union—and the story has been the old, old one. Agreement among the first four, based firmly on mutual confidence, has been attained on almost every question. Agreement between the four free states and the Soviet Union, in the absence of confidence, has been attained with great difficulty and after long debate on a few points, but on most of the important questions no agreement at all has been possible.

That is where the interlocking problems of disarmament and security stood in the autumn of 1957.

When the last session of the Disarmament Sub-Committee adjourned in London, early in September, 1957, it had before it a comprehensive proposal, agreed to by the four Western members, of which the provisions may be summarized as follows:

1. **Safeguards Against Surprise Attack**, by providing for reciprocal inspection of agreed areas of the territory of the U. S., other western States, the U.S.S.R. and its satellites. This inspection is to be carried out partly by aerial photographic flights, and partly by stationing teams of ground observers at critical points such as seaports, rail junctions, main highway junctions and airfields.

2. **Control of Fissionable Material** by providing that no such material hereafter produced shall be used for the manufacture of weapons, but solely for peaceful purposes (such as industrial power), and providing for an international inspection system to verify this. Further, parties now having nuclear weapons (U. S., Britain, U.S.S.R.) are to make periodic transfers of

fissionable material from weapons stockpiles to non-weapons use, thus gradually reducing the size of the weapons stocks.

3. **Suspension of Tests of Nuclear Weapons** for a period of two years, with extension of this period provided for if the rest of the program is then making satisfactory progress.

4. **Space Missiles** to be controlled by appointment of a technical commission to draw up plans which will provide that the sending of objects through outer space shall be only for peaceful and scientific purposes.

5. **Reduction of Conventional Armed Forces** by agreed limitations on manpower and reduction of weapons stocks.

6. **International Control** of the carrying out of all provisions of the agreement by a suitable international body.

These proposals were presented as a "package," the various parts being considered as interdependent.

They were rejected by the Soviet representative as a "sham" and as "containing nothing of value."

Study of the proposals, and of official Soviet and western comment thereon, reveals these areas of difference:

1. The U.S.S.R. accepts the idea of aerial inspection in principle, but differs with the West as to the areas to be subject to such inspection. One Soviet proposal provided for inspection of most of Western Europe and some of the satellite areas, plus the eastern half of Siberia (largely non-industrial and including military installations of importance only on the Pacific Coast), and finally the western half of the Continental United States (an area of the highest military and industrial significance, including the bulk of our nuclear and missile production and research installations). The U. S. has made various counter-proposals—one to include the whole of U. S. and Soviet territory, Western Europe and outlying base areas; another—a try-it-out plan—to include only the Arctic region and certain adjoining areas, across which air attacks might be delivered. These the U.S.S.R. has rejected. Differences also exist as to the degree of freedom of action and access to installations, etc., to be allowed the proposed ground observers.

Comment: The Soviet maneuvers seem directed toward trying to gain an advantage commensurate with the advantage that the West would gain by being able to

"fix" precisely the location of many places and installations in Soviet territory. Maps of the U.S.S.R. available in the West are notoriously inaccurate, whereas maps of the greatest precision are available to them covering all Western nations. Safeguards against surprise attack nevertheless remain the most important single point under discussion: if this could be achieved, an atmosphere of returning confidence might eventually result in which further progress would become possible.

2. Control of fissionable material, as proposed, has met with no Soviet favor whatever.

Comment: Some Western observers believe that the Soviets are reluctant to "freeze" weapons stockpiles at present levels, leaving the West with a considerable superiority.

3. The Soviets have repeatedly demanded unconditional stoppage, forthwith, of weapons tests, but they refuse to link this with any stoppage of weapons production, as the West demands.

Comment: One Soviet purpose may be to check further U. S. testing of tactical atomic weapons, which threaten to overshadow the present Soviet advantage in land-force manpower. They are also undoubtedly seeking a propaganda advantage, in view of the world-wide anxiety as to the injurious effect of "fall-out" from these tests.

4. The U.S.S.R. has derived very great propaganda advantage from being the first nation to produce a successful space-flying artificial satellite. While the satellite itself is a research vehicle and not a weapon, it was produced as a by-product of the Soviet missile program. It indicates that Soviet development of space-flying missiles is somewhat in advance of the U. S. program at this time. Whether the U.S.S.R. will, in a position at least of temporary advantage, be willing to agree to any prohibition of the use of outer space for military purposes is questionable. It seems more likely that, while exploiting their propaganda advantage to the full, they will press on with their missile program and may well impose on the U. S. the necessity of vigorous and costly counter-efforts in the same direction.

If, however, negotiation should prove possible in this field, an agreement to confine the exploration of outer space to peaceful and scientific purposes would prove of lasting benefit to mankind as a whole. The technical means to detect any violation of an agreement to stop testing space-flying missiles exist. Without tests, further development of such missiles could not continue. This would mean that space-travel and inter-planetary research would become the province of an international

scientific body, confining war to the limits of the earth's surface and its atmosphere.

5. The Soviets have repeatedly agreed to manpower reductions in the armed forces of the major Powers, though the precise character of the safeguards they would accept remains unclear.

Comment: Doubtless the Soviets, like others, would like to release additional manpower for industry and agriculture. Doubtless, also, they anticipate some reduction in their oversized ground forces may be necessary as a result of expansion of their air and naval forces, and may be acceptable because the increased fire-power of nuclear weapons prohibits mass tactics on future battlefields. The reorganization of land forces for use of nuclear weapons is explained at the end of this article.

It should be kept in mind that the Soviet reserve system is much more highly developed than that of most other states, so that they can recall men for military service more quickly than others.

Summing up these various considerations, the great unresolved question seems to be this: Can any agreement to limit armaments be reached under conditions which will make a real contribution to peace and security, in the total absence of confidence between the free and the Communist world-blocs?

The outlook appears gloomy. Yet the hard fact remains that the Soviet leaders know they have no real hope of realizing their dream of world domination save at the cost of a war of mutual destruction. Short of that, they as well as we must continue to live in fear and to bear the awful economic burdens of mounting arms expenditures. The increase in the cost

Defense Expenditures of the Great Powers

¹ Includes military aid to foreign states, atomic energy program and stockpiling of critical materials. ² British Empire (incl. India) 1937; 1951-56 United Kingdom, Canada and Australia. ³ At official exchange rate—350 francs = \$1 U.S. ⁴ Estimated. ⁵ Occupation costs (West Germany only). ⁶ West Germany only (incl. occupation costs). ⁷ At official exchange rate—4 rubles = \$1 U.S. Does not include atomic energy program and other military production costs. Accurate figures not available.

of weapons extends not only to nuclear armaments and long-range missiles, but to every category of weapon. Armies, navies, air forces have all become dependent on complex and expensive machines and equipment. With this increase in the cost of weaponry comes an accompanying increase in the cost of the skilled manpower required to operate and maintain the weapons. The day of cheap "cannon fodder" is over. Today, the armed forces must—at least in the free countries—compete with private industry for the services of skilled technicians and adjust their pay scales and conditions of service accordingly. Even the Soviets, with better control over individuals, are under severe internal pressures, arising from the desire of their people for better food, clothing, housing, the decencies and amenities of life. All this being so, it is too soon to despair of eventual agreement on easing the arms burden—as an acceptable alternative to the prospect of mutual suicide or mutual exhaustion and economic collapse.

Confidence is still lacking. In the international sense, it is in any case a slow growth. But increased security, with safeguards, is far from impossible if all truly desire it.

Armies of major powers are being reor-

ganized for the new tactics involved in the battlefield use of nuclear weapons. This necessitates: (1) smaller units; (2) wider dispersion, hence better communications; (3) greater mobility, with increased dependence on air supply. The basic purpose is to avoid creating large targets for hostile nuclear attack. The U. S. Army has made greater progress in developing nuclear weapons for army use than have the other two nuclear powers (Britain and U.S.S.R.).

The nuclear reorganization of the U. S. Army (begun 1957, to be completed in the Regular Army in 1958) is known by the term *Pentomic*—from "Penta" (five) and "atomic." It features commands of five sub-units instead of three as formerly, providing greater flexibility.

TYPES OF DIVISIONS
(U. S. Army—1957 "Pentomic" Plan)

Type	Total Personnel	Infantry Soldiers (approximate)	Tanks	Guns	Missile Launchers
Infantry	13,748	7,000	122	66	2
Armored	14,617	4,000	343	70	2
Air-borne	11,486	8,000	None	45	4

DEFENSE POSTURES OF LEADING POWERS

The defense frontiers of the United States have been extended to many parts of the world and this factor creates the need for greater expenditures for armaments and the armed forces.

The armament needs will change with the development of nuclear weapons and

missiles but, until the transition of the armed forces to nuclear status is achieved, we believe that you will be interested in the present comparative military strength of the Western world powers and the Communist world powers. The tables and text following, provide this information.

Armed Forces of U. S. and United Kingdom

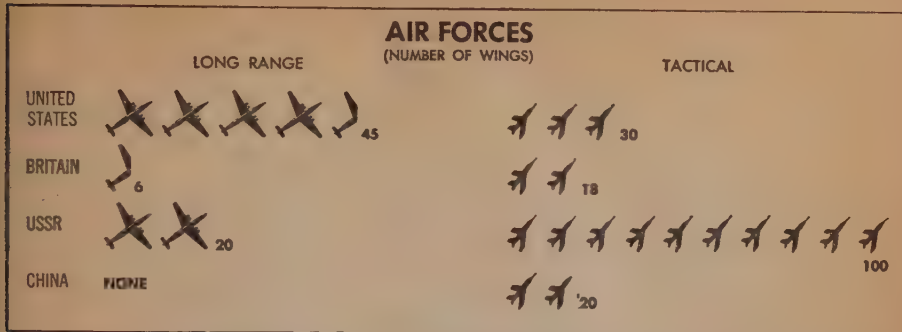

Country	LAND FORCES		AIR FORCES			NAVAL FORCES		
	Divisions		Wings		Air Defense (capability)	Long Range Striking Forces (attack carriers)	Submarines (ocean-going)	Anti-submarine Defense (capability)
	Active	Reserve	Long range	Tactical				
United States.....	19	37	45	30	Good	21	200	Good
United Kingdom.....	9	12	6	18	Good	6	60	Good

The defense system of the free world is built around the mobile striking power of the United States, operating from the continent of North America. It includes these elements:

1. **SHIELD FORCES** of ground troops plus tactical air power designed to hold

off Communist attack at the various points of contact until reinforced. These may be furnished by the countries immediately concerned, or may (as in Germany and Korea) include U. S. or other allied forces.

2. Control of the sea and overseas air-lanes (including their defense against

Soviet submarines, aircraft, etc.) to provide prompt **REINFORCEMENT** of any threatened free nation from the U. S. or other allied territory.

3. The **DETERRENT** power of U. S. (and British) long-range air and sea striking forces, designed to prevent the U.S.S.R. from initiating full-scale nuclear war by presenting an unacceptable risk of nuclear retaliation and to defeat such an attempt should it be made.

4. **AIR DEFENSE** of the allied nations, their bases and military installations.

The basic characteristic of the free-world defense system is *mobility* (i.e. freedom of movement by land and sea, outside the Communist area) and in its operation, *time* may well be the most important

factor. The forces of the Communist states are relatively immobile, except as they can develop a capacity for surprise nuclear attack with planes and missiles. Thus the Communist states (especially the U.S.S.R.) are compelled more and more to use the threat of such attack as the principal military support of policy, and the character of Soviet armament is changing accordingly—notably in the development of intermediate and long-range missiles.

The defense system of the free world must continue to be capable of dealing with local or limited aggression, and of deterring or defeating total aggression. Its end purpose is to prove to the Communist leaders that armed aggression of either type is not going to be profitable.

Armed Forces of U.S.S.R. and China

Country	LAND FORCES		AIR FORCES			NAVAL FORCES		
	Divisions		Wings		Air Defense (capability)	Long Range Striking Forces (attack carriers)	Submarines (ocean-going)	Anti-submarine Defense (capability)
	Active	Reserve	Long range	Tactical				
U.S.S.R.....	160-200	175-225	20	100	Medium	0	275-300	Poor
China (Communist)	116	†	0	20	Poor	0	4-12	Poor

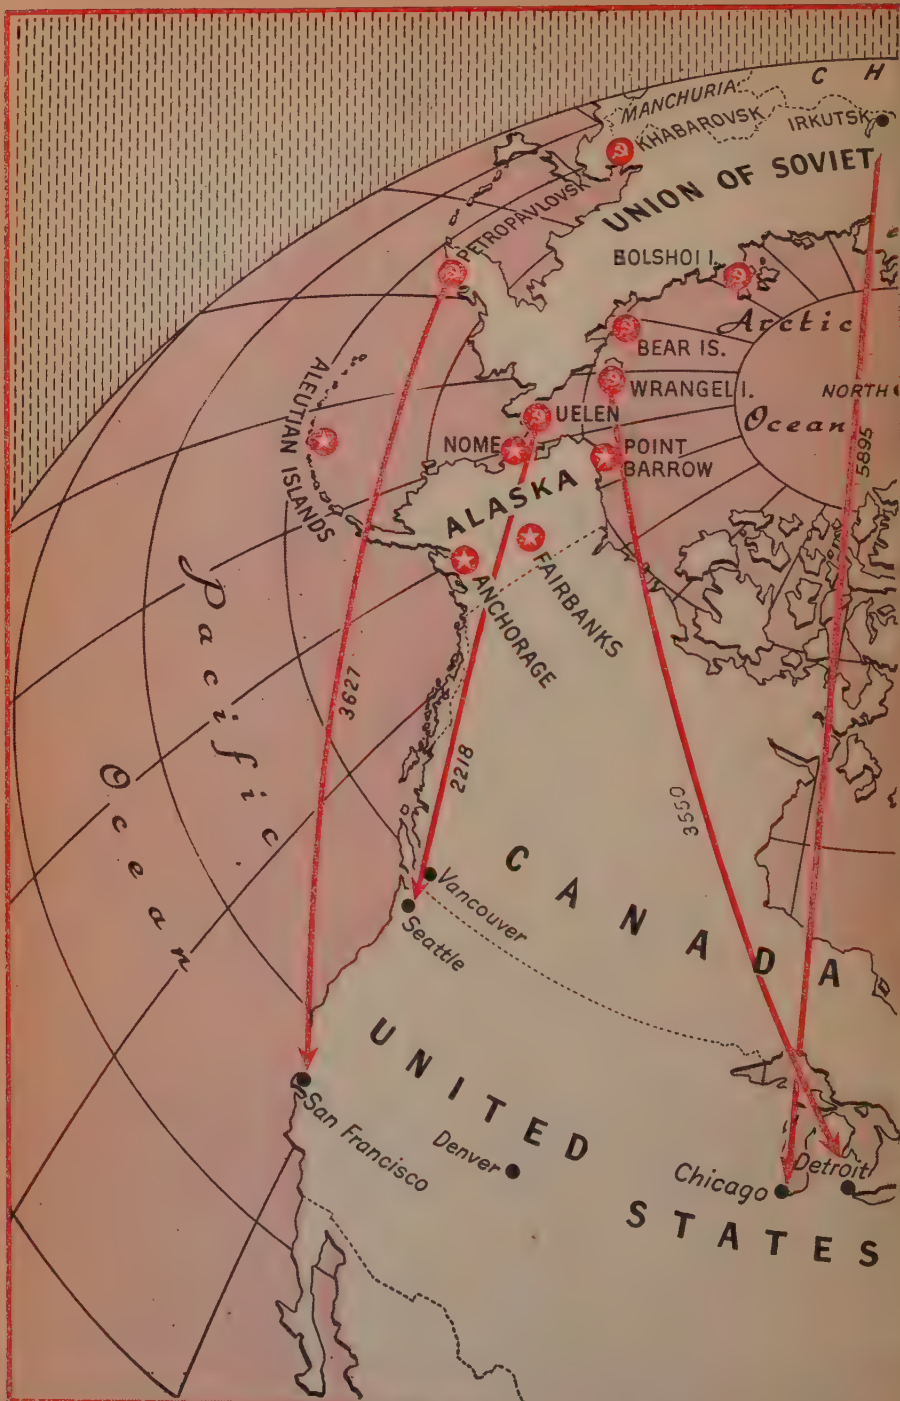

The Communist countries (U.S.S.R., Red China and satellites) occupy a solid territorial bloc which includes most of east and east central Europe and the greater part of Asia. They have very few islands (except along their coasts), no overseas possessions and limited access to the world's oceans. Around the perimeter of their huge land area they are in direct contact with many free nations, most of which are associated with the U. S. in defensive alliances.

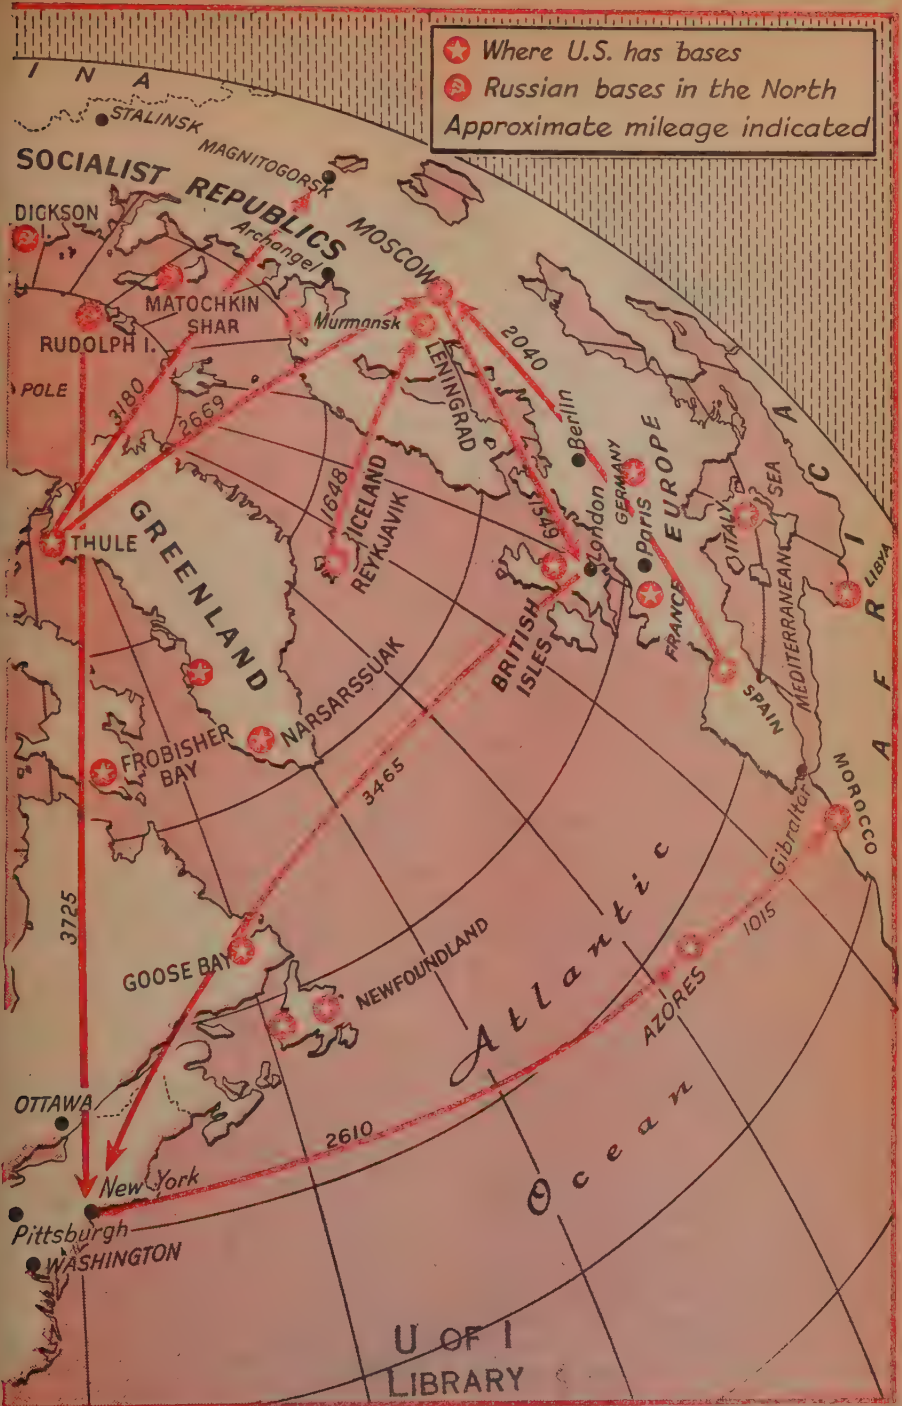

Communist policy requires large land forces, supported by strong tactical air forces. These are needed partly to maintain a continuous threat against free

neighbors, partly to control their own and satellite populations. The U.S.S.R. also has a long-range air force of medium strength, its sole means of offering a direct threat to the U. S.; this force may become more dangerous in the future due to the development of very long-range missiles. The Soviet navy is limited to elements suited for denying the use of the sea to the free states, but not for controlling it (submarines, mines, surface raiders).

The military power helpful to the free world is, of course, augmented by the United States and other nations outside the Communist orbit.

A table of these armaments is listed in the table "Military Alliances" on page 52.

DISARMAMENT TALKS REVIEW

- 1947
- Feb. 13 United Nations Commission for Conventional armaments created. (It accomplished nothing.)
- 1951
- Dec. 17 U. N. General Assembly voted to set up a new Disarmament Commission which would deal with both atomic and conventional weapons. It had 12 members—nations on the Security Council plus Canada. (It got nowhere.)
- 1953
- Nov. 28 U. N. General Assembly set up a Disarmament subcommittee consisting of U. S., U.S.S.R., Great Britain, France and Canada.
- 1956
- Nov. 17 Russia accepts principle of aerial inspection zones, but does not define them.
- 1957
- Jan. 14 U. S. gives U. N. new 6-point plan for arms reduction.
- Mar. 18 U. N. Disarmament subcommittee starts new negotiations in London. Russia and West agree in principle to reduction of armed forces.
- 18 Russia proposes withdrawal of Atlantic Pact and Warsaw Pact forces from foreign soil and liquidation of all foreign military bases.
- June 25 U. S. offers 3-stage reduction in armed forces to below 2 million if Russia will do likewise.
- July 2 U. S. proposes a 10-month moratorium on nuclear weapons tests, provided that there is inspection.
- Aug. 2 Dulles proposes reciprocal air inspection of all continental U. S. and all Russia.
- 21 U. S. offers to halt nuclear weapons tests for 2 years.
- Sept. 6 U. N. disarmament talks in London recess indefinitely in deadlock after 5½ months.
- 19 Dulles brings disarmament debate into U. N. General Assembly.

WEAPONS DEVELOPMENT

By WILLY LEY

THE MAIN CHARACTERISTIC, and limitation, of firearms of the past is summed up nicely in the sentence that a miss of an inch is as good as a miss of a mile. The old solid iron cannon ball was a powerful projectile, but only if it hit. The same held true for musket balls and rifle bullets. However, the main aim of weapons development during the last half century has been to convert a miss, at least a near-miss, into a hit.

This could be accomplished in two ways, both of which were used. One was to fire with such rapidity that the bullets formed a kind of spray in the expectation that at least one of them would score a hit. In the most modern applications of this principle this has been carried to incredible lengths. There are now machine gun clusters for fighter aircraft which can fire several thousand bullets per minute, or at least could do so if the plane could carry enough ammunition. During a demonstration, where every bullet used was a tracer bullet, a ten second burst from this machine gun cluster looked like an enormous swarm of luminous beetles racing down the firing range.

The other method of converting a miss into a hit was to fire explosive shells which produced an *area* of destruction instead of a *point* of destruction as did solid shot. In the specific and difficult case of shooting at a fast moving target, such as an airplane, one additional answer was thought up, developed and used during the second World War. This was the "proximity fuze" or VT fuze (V.T. standing for "variable time") which accomplished spectacular results on many occasions. The working principle of the proximity fuze is both simple and somewhat incredible: the nose of the projectile is a tiny radio transmitter and receiver.

As the anti-aircraft shell rises the transmitter begins working. It was started by the hard push the shell received in the gun barrel. The transmitter sends out a steady weak radio signal. When the anti-aircraft shell passes an airplane this signal is reflected by the wings and fuselage of the plane. The shell catches the reflection which, of course, is the stronger the nearer the reflecting plane. If the reflection is strong enough the shell's fuze explodes, exploding the main high-explosive charge of the shell in turn. The shell splinters and the shock wave of the explosion are certain to put the plane out of action. Naturally the proximity fuze can be "set" for a certain dis-

tance. If the shell is a comparatively small shell the fuze may be set to explode only if the reflecting object is less than 20 yards away. A larger shell's fuze might be set for 30 yards. It goes without saying that the proximity fuze, though originally developed for anti-aircraft artillery, is now used for all kinds of anti-aircraft missiles, whether they are fired from the ground against airplanes or by other airplanes. Even a guided missile might still miss by a few yards; it is the proximity fuze which converts this near-miss into a destructive hit.

The atomic (plutonium) bomb and the hydrogen fusion bomb are, from this point of view, just very large extensions of the principle of the exploding shell, or bomb. The very heaviest bombs used during the second World War were popularly known as block busters which is a rather good indication of their destructive area. It amounted to nearly one city block, provided, of course, that the buildings on this area were wood or masonry buildings without steel skeletons. Atomic and hydrogen bombs have extended the destructive area to that of a small or medium sized city and in the case of the hydrogen bomb it is theoretically possible to make the area of destruction as large as seems necessary.

Everything that has been said so far referred to the weapons themselves, but this is only one aspect of the whole picture. In order to do its job the weapon has to be delivered. So far delivery has been simply by airplane, by large bomber, with the pilot trying to dodge enemy anti-aircraft fire from the ground as well as he could, while the gunners tried to take care of enemy fighter aircraft. The airplane—except for the fact that it could be attacked in turn—had two advantages over delivery by artillery. In the first place the heaviest artillery shells weigh about a ton, while a large airplane could carry several tons of bombs. In the second place the airplane could "deliver" over a range of many hundreds and even thousands of miles. In land warfare artillery was rarely used for ranges of over 12,000 yards. In naval battles firing has occasionally been started over more than twice this range but for ranges over 20 miles guns are not practical. During the first World War the Germans developed an artillery piece (the so-called "Paris Gun," often called Big Bertha because of an early misunderstanding on the part of the French) with a range of 80 miles but

with a caliber of only 8 inches. In the second World War the Germans followed this up with a gun of a range of 110 miles (same caliber). The Paris Gun caused a sensation while its successor of the second World War remained unnoticed.

Near the end of the second World War the long range missile became another means of delivery. It appeared in the two forms of the flying bomb V-1 and the long range ballistic rocket V-2. The V-1 was actually an unpowered airplane of about the size of a fighter plane—test models were actually flown by pilots—propelled by a simple jet engine. It climbed to the height for which its automatic pilot had been set—usually 2,000 feet—and then followed a straight course toward the target (London). After flying for 150 miles the fuel flow to the engine was cut, the control surfaces were automatically locked and the V-1 dived into the ground, exploding on impact. The missiles of the type first demonstrated by the V-1 are now known as "flightpath missiles" or "cruising missiles." They have grown larger and faster and increased their range from 150 to over 4,000 miles (for example the Air Force's *Snark*) but they still are really pilotless aircraft. For this reason they are vulnerable to interception just like a manned airplane. In fact they are somewhat more vulnerable because a human pilot can try to dodge.

This vulnerability is greatest when most of the flightpath leads over land; the enemy can have anti-aircraft batteries, guided missile emplacements, and interceptor airfields almost anywhere. If the flightpath leads mostly over water the vulnerability is lessened because nobody can have enough ships at sea to produce a really "airtight" interception.

The long range ballistic missile presents an entirely different picture. These rocket missiles take off vertically, then turn in the direction of the target and throw themselves into an arc which leads out of the atmosphere and ends up on the target. Even the fastest flightpath missile needs several hours to cross the Atlantic Ocean, a ballistic missile will do it in about 50 minutes. When this was contemplated at first it looked as if a long range ballistic missile would be the "ultimate weapon." This thought was strengthened by the wartime experience with the V-2 rocket. The V-2 rocket had a range of about 200 miles and needed a little less than six minutes to crash into the target, counting from the instant of take-off. Even though such V-2 rockets, en route to the target, could be and often were, caught on radar screens, there was nothing anybody could do about it. No defensive weapon could reach 50 miles up and from

detection to impact there were only about two minutes left.

With the intercontinental missile, because of their very range, things are different. A radar defense especially geared for their detection, might "catch" them some 20 minutes before impact. This is enough time to compute the trajectory of the missile, from which it cannot deviate by the laws of Nature, and for throwing a few dozen anti-missiles into its path. One such anti-missile missile is now under development.

In military reasoning the advantages are almost never on one side only. The ballistic missile of comparatively short range won't be intercepted in flight but has to be brought into range first and whatever brings it into range is likely to be intercepted. The very long range missile can be intercepted in flight, but does not suffer the logistic drawback of long transportation. It could be fired, so-to-speak, from the backyard of the factory which makes it. In reality the enemy would be able to track back to the factory quite soon even if he does not know its location from the outset.

There is still one possible trick which could be used with flightpath missiles. They could take off from the factory's backyard but could first be flown several hundred miles in almost any direction over friendly territory at very low altitudes. Only when they cross the border of friendly territory would they start out on their real mission. The trajectory of a ballistic missile could not be disguised in this manner. It would have to be shipped by land, or possibly by air transport, to ever changing firing sites.

While the weapons development over the last half century or so has done a great deal to convert misses into hits it has also resulted in a steady decrease of the number of actual fighting men. In the Napoleonic wars probably half of all the soldiers in uniform actually fought at one time or another. During the first World War this number was down to about ten per cent. For the second World War it has been estimated that it needed 98 men in uniform just to equip and to supply two fighting soldiers. Of course the percentage cannot very well go much lower than that—but what kind of men will these fighting men have to be?

No, they don't have to be scientists, all the actual brain work has been done in designing, testing and planning long before the fighting man is handed a piece of equipment. But he has to be trained in its use and he should, as far as possible, be able to understand the principles of his equipment and his weapons. Compared to a soldier in Napoleon's army he will be a highly educated man.

FOREIGN POLICY OF THE UNITED STATES AND THE U.S.S.R

By LOUIS M. HACKER, WILLIAM C. THOMAS, JR.,
and RAYMOND A. MOORE, JR.

FOREIGN POLICY OF THE UNITED STATES

IT WOULD BE UNREAL and also fatal to assume that American foreign policy is shaped from day to day and largely as a counterthrust to Russian foreign policy. On the other hand, the United States does not seek to impose on the world a *Pax Americana*—under which we ourselves would guarantee the peace at the same time that we extend our sway by economic and other means.

American foreign policy is based on the active faith that democratic institutions and the benefits of a free-enterprise system, as they spread everywhere, will assure peace, stability and growth. From their own experiences, Americans are ready to assume the falsity of the Marxist-Leninist prediction of the collapse of capitalism. Capitalism, instead of producing misery, crises and class war, has virtually eliminated classes, created devices for controlling the sharp swings of the business cycle, and is constantly advancing standards of living. All this has been accomplished in a climate of freedom. There are, in short, values and commitments which are real and stable and to these the United States adheres; at the same time their implementation must meet the changing needs of the give-and-take of international diplomacy.

Safety Through Defense

Always, the chief function of United States foreign policy, as with that of any state in mid-twentieth century world society, is to preserve the independent existence of the nation—its territory, its people, its institutions and its way of life. To achieve this fundamental goal, a secure international environment is required—the protection of the land, sea and air approaches to the United States becomes a necessity.

We have defenses against air attack through the maintenance of military bases in Greenland, Iceland, the Aleutians and even Antarctica and against sea attack by the establishment of bases in the Atlantic and Pacific Oceans and in the Caribbean Sea. The military and foreign policy arms of the government make commitments accordingly. The survival of the nation requires the countries of the Western

Hemisphere to come to the defense of any member nation attacked from inside or outside this region.

Because the security of the Western Hemisphere may not be sufficient protection for the United States, the defense frontiers have been extended to other areas where the dominance by an unfriendly country, such as the U.S.S.R. or Communist China, would threaten to upset an existent balance of power and so jeopardize the security of the United States. The Truman and Eisenhower Doctrines extend a shield of military protection to such vital areas as Greece, Turkey and the Middle East, where the countries concerned have requested, or should request, such aid.

In essence, then, the United States, for the sake of its own security, must seek to preserve a favorable balance of power in the Western Hemisphere and to maintain the existence of a balance in Europe and Asia which will deter the U.S.S.R. and Communist China from establishing hostile hegemonies. It continues to use all means, including the willingness for putting out "brushfire wars," to prevent such developments.

Because the power of the United States is limited by its being only one, although a large and powerful one, of some ninety nations in the world today, the government has allied itself with like-minded governments to seek more effective implementation of its policies. For this reason the United States has been instrumental in the creation of such organizations as the North Atlantic Treaty Organization (NATO), the South East Asia Treaty Organization (SEATO), the Anzac Pact with Australia and New Zealand, and the Baghdad Pact, as well as the Organization of American States (OAS), which protect the United States as well as other member states against the danger of an armed attack.

Also, major foreign aid programs such as the Marshall Plan and the present International Cooperation Administration seek to enhance United States security as well as to extend and preserve economic and social conditions conducive to freedom.

To Help Free Peoples

Although the protection of the independence and security of the nation constitutes the most fundamental aims of United States foreign policy, they are by no means the only ones. Other, more positive goals—the preservation of peace, the extension of democracy and freedom, the economic advancement of the free world and the promotion of general commerce—take on added significance once the minimal goals are partially realized. Those aspects of foreign policy mentioned in connection with the minimal goals do, of course, often promote more positive aims as well.

To further these intentions, the United States supports international economic agencies—the World Bank, the International Monetary Fund, the technical assistance programs of the United Nations, reciprocal trade agreements, the General Agreement on Tariffs and Trade, and some 150 other organizations concerned with regulating and promoting commerce. It seeks to expand the world economic community where a greater mobility of trade, capital movements and labor will be achieved.

Its programs of aid for allies and friends have often been primarily for economic improvement rather than military aid—twenty billion dollars to Western Europe between July 1, 1945, and September 30, 1950, for example. Aid programs have become, the President of the United States has said, “an integral part of our foreign policy.” At the same time, private American capital is encouraged to expend its investments abroad and, in the process, help in the opening up of new resources and the creation of industries through which native standards of living will advance.

American foreign policy, in brief, encompasses the assumption that the continued economic progress of free peoples will be the strongest possible force for peace and stability.

The more positive goals of the United States foreign policy are further advanced by the government's participation in the United Nations, which it recognizes as an indispensable, if somewhat fragile, agency in the preservation of peace. Experience has demonstrated that the purposes and methods of this international organization coincide to a substantial extent with the major outlines of this country's policy.

While it has not been as effective as America desires, it has proven useful as an instrument for checking expansionist tendencies in such places as Korea and Indo-China, for dampening controversies such as the Egyptian-Israeli disputes, and for focusing public condemnation upon

the oppression visited upon Hungary in 1956. The positive goals are also furthered by the advancement of President Eisenhower's program of harnessing nuclear power to an “Atoms for Peace” agency within the United Nations; by the dissemination of information through the United States Information Agency; and through efforts to expand cultural exchanges with Communist countries in the belief that exposure to American institutions and ideas will shake the certainty of the scientists, industrial managers and educated classes generally of the Communist world.

The Clash of Economies

The achievement of the goals of American foreign policy in the mid-twentieth century demands that domestic tranquility be maintained within the United States with a relatively high degree of unity behind the broad policies of the government. An expanding economy of high employment is requisite as an adequate defense establishment prepared for both general and limited war.

One of the chief problems of United States foreign policy, besides the maintenance of unity and prosperity at home and among its allies, involves its relations with the Sino-Soviet bloc of nations. These nations, especially the Soviet Union and Communist China, constitute a major threat to the security of the United States because of the fusion of a hostile revolutionary doctrine of Marxist-Leninist Communism with the enormous power of the Russian and Chinese states. Further, the U.S.S.R. is capable of producing nuclear weapons of unprecedented power and intercontinental ballistics missiles. This is augmented by the strength of historic Russian and Chinese nationalism which would constitute problems for America today even without Communist ideology.

Leaders of the Soviet Union regard the “principal characteristics of our epoch” as “the emergence of socialism from the confines of one country and its transformation into a world system.” They declare that “capitalism has proved impotent to hinder this world wide process.” Such sentiments, harnessed to a population of over 215 million on an area three times the size of the United States, with the second largest industrial capacity of any nation—plus the largest standing army in the world, constitute alone a major challenge to America. But, joined by Communist China, which has a population of 600 million on over four million square miles of land and an army of four million plus six to ten million in active reserves, the challenge is compounded.

Coupled with this problem have come the colonial revolutions in Asia, Africa and

the Middle East. Nationalism in these areas has often been utilized and exploited by Communists for their own purposes. The United States looks at the risings of these natives of undeveloped areas with a sympathy rooted in the memories of its own origins. But, the problems of encouraging and aiding these justifiably impatient peoples to acquire the stability

and strength they need to preserve the independence, freedom and economic gains they desire so greatly—and yet to have friendship for the United States—are incredibly complex.

How the United States resolves these problems, among others, will determine the success of its foreign policy for the remainder of the century.

FOREIGN POLICY OF THE U.S.S.R.

THE FOREIGN POLICY of the Soviet Union is conditioned principally by the physical facts of her existence, the historic policies of the Russian State and the joining of Marxist-Leninist doctrine to these factors.

As the greatest landlocked empire in history, the Soviet Union covers eight million square miles—one sixth of the earth's surface. It is a land rich in resources: coal deposits are estimated at a billion and a half tons; oil reserves are undoubtedly very large; and there are large deposits of strategic minerals. The Soviet Union comes closer to achieving self-sufficiency than any other nation, excepting perhaps the United States. Her population of approximately 215 million shows an annual increase of more than 3 million and has a young median age (23). Joined with Communist China and the Soviet satellites, the Soviet Union represents over one half of the world's people.

The Soviet economy is second only to that of the United States and has shown, except in the agricultural sector, high rates of increase in the post-war years. From 1947 to 1953 its gross national product grew at the approximate rate of 7 to 8 per cent, with 12 per cent in industrial growth, while the figures for the United States are $4\frac{1}{2}$ to 5 per cent and 5 per cent respectively.

The Soviet Union maintains the world's largest standing army—some 2,500,000 with reserves of 6,000,000. Her navy is now the world's second largest and her submarine fleet is actually the largest. In quantity and quality the Soviet Air Force rivals that of the United States and its production of missiles (intermediate and long-range) is considered by many competent authorities to be slightly in the lead. She has exploded both atomic and hydrogen bombs, but her production lags behind that of the United States. Militarily she excels in manpower, lacks firepower, but is making rapid strides to compensate for this lack. The implications of such facts are, of course, that Soviet foreign policy can be strong and is indeed something to be reckoned with.

On the other hand, there are physical

limitations which she must face. Russia's state in 1917 was almost a feudal one. Most western countries have at least a hundred years' head start on her in economic and social development. Moreover, she is in much less of a position than the United States to produce both guns and butter. As members of her population become more educated—and to become an advanced technological nation Russia must educate more and more people—they demand higher standards of living. Her leaders more and more are compelled to promise an increase in consumer goods; this imposes limits on expenditures for arms.

Czars to Commissars

Besides the conditioning factors of physical realities, the foreign policy of the Soviet Union today manifests in many ways the characteristics that Russian foreign policy has had for centuries. Such policy was made up of alternations of expansionism and isolationism, of contact and imitation of the West with withdrawal and suspicion of the West, of a balance of power and regional hegemony, and of spheres of influence and collective security.

Specifically, Russian national policy sought:

Warm water ports to the South in the Bosphorus and the Dardanelles;

Windows to the West in the decaying Ottoman Empire;

A security belt in Eastern Europe;

Windows to the East in Siberia, Outer Mongolia and the Maritime Provinces.

Modern Soviet policy has abandoned none of these goals.

Since the October revolution of 1917, there has entered into Russian policy an element—Marxist-Leninist doctrine—which not only supports these traditional nationalistic Russian aims but goes beyond this to have an impact at the outer periphery of the country's national interests. The fusion of the Communist ideology and the historic aim is so complete that it is difficult to tell where one begins and the

other leaves off, especially in those areas contiguous to the Soviet Union and those impinging on Soviet vital interests. At any rate, the doctrine has proven to be a powerful force. It teaches that world society, functioning under the "laws" of "dialectical materialism" or "historical materialism," has reached a stage under which capitalism, having performed its historical mission, is doomed.

The capitalist countries, according to this ideology, must collapse for the following reasons:

- 1) Their peoples are sharply divided into rich and poor;
- 2) The means of production are concentrated in the hands of great monopolies;
- 3) The working classes are being reduced to a condition of increasing misery;
- 4) At the same time, crises or business depressions occur more and more frequently;
- 5) Class wars are now in the open, and they must lead to revolution.

History, in short, according to Marxist-Leninist doctrine, is on the side of the Russians and sooner or later capitalist countries will collapse because of these "laws" of their development and decline.

In its ideological perspectives, the Soviet Union's foreign policy strives to achieve its major objectives of spreading Communism throughout the world in general and of hastening the collapse of capitalistic countries in two ways:

- 1) It is the center and inspiration of the Communist conspiracy by which native Communist parties preach the theory of "class war" to create dissatisfaction among working classes. Such infiltrations are particularly effective among colonial peoples and those of new countries where advances in standards of living must perforce be slow (India, Indonesia, Northern Korea);
- 2) It is constantly seeking to keep the world in turmoil so that the western powers and their allies will be forced to diffuse their strength to keep Communist advances contained or to prevent their spread. Since the end of World War II, Russia has made it a practice to probe at such "soft spots" as Korea, Vietnam, and, currently, Indonesia and the Middle East.

Russia's Goals

Since 1917, after having gone through a number of stages of retirement from and co-operation with the western world, the Soviets more recently have adopted a nationalist outlook.

Today, the Russian vital interests in-

clude, first, the survival of the Mother Land of Socialism—its peoples, institutions and the Communist way of life. Secondly, they include security policies involving an Eastern and a Western zone. On the west are the deferential but increasingly restive and unstable satellite governments. On the east there are large neutral areas and China, a friendly and dependent ally though possibly a rival ultimately. Beyond these security zones, the foreign policy of the U.S.S.R. seeks, at minimum, a balance of power in Europe, a friendly neutral or disarmed Japan and Germany, access to the North Sea, the Mediterranean and the Pacific Ocean, and spheres of influence in the Middle East, South East Asia, Africa, Arctic and the Antarctic.

In sum, the Soviet Union embraces a long range goal of a Communist world, a middle range goal of a balance of power with capitalist states. Since the means employed to achieve these goals are flexible, realistic, ruthless and dynamic, the Soviet Union, particularly when joined with Communist China, the satellite nations and the world-wide Communist parties, presents an imposing picture of power ready and able to defend and advance its interests by both military and ideological tactics. That these tactics have enjoyed considerable success is one of the major facts of our time, causing great concern and defensive responses by large areas of the non-Communist world.

Since 1939, the Soviet Union has annexed some 400,000 square miles of territory, established controls over Eastern Europe, including Eastern Germany and Albania, seen the triumph of Communism on the Chinese mainland and in parts of Korea and Vietnam, and has extended its influence (through local Communist parties) in India and Indonesia. Egypt and Syria—by large arms shipments—have been brought into its sphere of influence.

Although it has been remarkably successful since World War II, it has met with effective resistances from the North Atlantic Treaty Organization, the Organization of American States, the force of the United Nations in Iran and Korea, the defeat of the Huks in the Philippines and of the Communists in Malaya.

Actual defeats have been suffered by the defection of Tito, the Berlin Air Lift and the revolts in Poland and Hungary.

Since Stalin Died

Since the death of Stalin, March 5, 1953, Mao-Tse-tung has emerged as senior spokesman among Communist leaders; and a struggle for succession in Russia in many ways similar to that following Lenin's death in 1924, has followed with Khrushchev emerging as the first among

equals—in part due to the increased power of the Soviet Army represented by Marshal Zhukov who seems to have sided with Khrushchev.

The appearance of new leadership in the Soviet Union has pointed up problems of Soviet agriculture, rigid centralized economic planning, the secret police,

forced labor, and the pressures of a rising Soviet managerial class. It has also recast Soviet tactics into more flexible lines so that Soviet policy can still pursue Communist aims in a world of stalemated nuclear powers where the competitive coexistence of cold war goes on and yet does not threaten a general war.

For new developments, see pages 18-19.

MAJOR U. S. POST-WAR POLICY DECISIONS

The Marshall Plan

After World War II, recovery programs among the nations of Europe, as well as contributions from the United States, were unco-ordinated. In June 1947, Gen. George C. Marshall, then Secretary of State, asserted the need for integrated recovery efforts against "hunger, poverty, desperation and chaos." Congress, April, 1948, appropriated \$5.4 billions. The United States established the Economic Co-operation Administration while European nations set up the Organization for European Economic Administration. Under a system of counterpart funds, each participating government set aside in its own currency amounts matching the aid it received. As the European Recovery Program, Marshall Plan aid was economic in its early stages but with the worsening international situation—particularly after Korea—emphasis was shifted to rearmament. When ERP ended in Dec. 1951, a year ahead of schedule, it had cost \$11 billion but substantial amounts had been committed to collateral military ventures.

Truman Doctrine

President Truman took a decisive step in March, 1947, when he obtained from Congress authorization to spend \$400 million to aid Greece and Turkey. His move followed directly on withdrawal of aid to those countries by Great Britain, whose

resources were dwindling. Greece suffered from Communist guerrilla infiltration; Turkey lived under threat of Russia's constant pressures. Besides the appropriation, Congress authorized shipment of military equipment and dispatch of a military and technical mission. By 1950, the Red guerrillas had given up the struggle and in Turkey results were much more immediately successful. The Truman Doctrine is regarded as the first significant experiment in the policy of "containment," although it preceded by four months the intellectual presentation of this policy by George Kennan.

Eisenhower Doctrine

In January, 1957, President Eisenhower, noting the unsettled state of the Middle East, asked authority from Congress to co-operate with any nation in that area for economic development, to undertake programs of military assistance for such nations which desired it and to use U. S. armed forces to protect Mid-East countries "requesting such aid" against "overt armed aggression from any nation controlled by international communism." In March, Congress authorized expenditures up to \$200 million for 1957. Anti-Communist declarations were immediately forthcoming from Lebanon and Libya and more important, King Hussein of Jordan, took a strong stand against the leftist drift in his country. Arms also were shipped to the area to counter the build-up of Soviet military equipment in Syria.

U. S. POST-WAR TREATIES

North Atlantic Treaty Organization (NATO)

(Formed: April 4, 1949)

Members: United States, Canada, Iceland, Norway, Great Britain, Netherlands, Denmark, Belgium, Luxemburg, Portugal, France, Italy, Greece, Turkey, West Germany

In 1948, the United States government began talks with the signers of the Brussels Pact and Canada concerning the formation of a regional defense treaty in the North Atlantic area. It represented the first important security pact with European nations since the French Alliance of 1778 and marked the first time in United States history that the United States pledged itself to go to war in support of allies before the

actual outbreak of hostilities. The U. S. Senate ratified the treaty July 21, 1949.

The United States, acting under Article 3 of the Treaty, began a program of military assistance which at the end of the fiscal year 1957 will have amounted to nearly \$10 billion. Roughly half of all United States military assistance has gone to members of NATO. However, almost 85% of NATO's military preparation has come from the European countries themselves, increasing from about \$6 billion in 1949 to \$12 billion in 1955. The United States has nevertheless assumed almost one-third of the cost of equipment and the facilities of mutual military bases.

NATO now united most of the countries of the Atlantic community plus Greece, Turkey and West Germany, which were added to the original membership. Its organization comprises the top foreign, economic, defense and financial ministers of the member countries. The military responsibilities of NATO are divided into two major commands—SHAPE for Europe and SACLANT for the Atlantic Ocean area. SHAPE at present has 47½ divisions. SACLANT relies on naval strength to control the sea lands of the North Atlantic.

Western European Integration

Members: France, Italy, West Germany, Belgium, Netherlands, Luxembourg

A step-by-step process, the first came in 1944 when Belgium, the Netherlands and Luxembourg formed the Benelux Customs Union. Next, sixteen Western European nations created in 1948 the Organization for European Economic Co-operation (OEEC), to reduce import limitations and advance convertibility of currencies through the European Payments Union. Then followed establishment of the European Coal and Steel Community (1952), by which France, Italy and West Germany erected a supranational organization, which has set up a common market in coal and steel. These successes led to creation by the same six nations, in March, 1957, of Euromarket, to stimulate trade by eliminating customs barriers, creating common tariffs, cutting exchange restrictions, etc., and of Eurotom, an atomic energy pool.

Southeast Asia Treaty Organization (SEATO)

(Signed: Sept. 1954)

Members: United States, Great Britain, France, Australia, New Zealand, Pakistan, Thailand, Philippines

Weaker than NATO, SEATO does not include rigid provisions for collective defense but states that armed attack on any member would be regarded as a threat to safety of the others. SEATO represents the United States' desire to counterbalance the power of Communist China. Yet three major non-Communist members—Indonesia, Burma and India—are not members.

Baghdad Pact or Middle East Treaty Organization (METO)

(Signed: Nov. 1955)

Members: Turkey, Iraq, Iran, Great Britain, Pakistan

Although it inspired the pact, the United States is not a member. The pact's purpose is to provide a defense shield on the northern tier of the Middle East against Soviet penetration.

Organization of American States (OAS) and the Rio Treaty

In Sept. 1947, 18 Latin American countries (Nicaragua and Ecuador were excluded) and the U. S. signed at Rio de Janeiro the Rio Treaty under which all signatories agreed to protect against aggression every state in the Western Hemisphere. In Apr. 1948, all the American nations (21—Canada not included) joined in the Organization of American States (OAS) to implement the Rio Treaty and form a collective security system.

Reds' NATO—Warsaw Pact

Signed: May 14, 1955

Members: Albania, Bulgaria, Czechoslovakia, East Germany, Hungary, Poland, Rumania, U.S.S.R.

The Warsaw Pact was prompted by the admission of Western Germany to NATO and may be considered as the Communist equivalent in Eastern Europe to NATO in Western Europe. Article 4 of the agreement contains the same provisions as Article 5 of NATO, stating that an attack on one shall be regarded as an attack on all. Article 5 provides for a unified military command.

FRANCE

CIVIL RIGHTS

See Special Article on Supreme Court, page 84

Not since 1875, in the post-Civil War Reconstruction era, had the Senate passed a civil-rights bill designed to help Negroes get equal treatment. Many times such bills had died in the Senate as a result of Southern filibusters.

President Truman repeatedly asked for legislation to set up a Fair Employment Practices Commission—to give Negroes more job opportunities—plus companion legislation to make lynching a Federal crime (as opposed to state) and to outlaw the poll tax in the South.

President Eisenhower took a different approach in his first State-of-the-Union message, emphasizing the need of Federal action to assure Negroes of their right to vote—a right which they were commonly denied in some southern localities.

In 1957, the Eisenhower Administration proposed to Congress a civil-rights bill. Its main provisions were:

Part I—Set up a Federal civil-rights commission to investigate cases of racial discrimination.

Part II—Establish a special civil-rights division within the Department of Justice.

Part III—Permit Federal courts to issue injunctions to implement a broad range of civil rights, including the right to attend an integrated school in the South.

Part IV—Permit the Federal government to obtain injunctions against interferences with voting rights. Violators could be punished by Federal judges.

The House passed the bill substantially as proposed by the Administration.

The Senate cut out almost all of Part III, thereby limiting the bill to guarding the voting rights of Negroes, not their civil rights in general. The Senate also amended Part IV to provide for jury trials in cases of criminal contempt of court instead of decisions by judges alone.

The changes were opposed by the Administration, but were successfully supported by Southern Senators with the aid of moderates in both parties. In return for adoption of the changes, the Southerners refrained from filibustering the bill to death. In fact, 5 Southern Senators broke with tradition and voted for the bill, which in its amended form was passed by the Senate.

In its final form, as a result of a Senate-House compromise, the bill limited the jury-trial provision to cases involving penalties of more than \$3,000 fine or more than 45 days in jail.

1956

Apr. 9 Atty. Gen. Brownell sends civil-rights recommendations to Congress. (Bill passed by House but died in Senate.)

1957

June 18 House passes slightly revised civil-rights bill, 286-126. (Democrats voted 118, Yes; 107, No. Republicans voted 168, Yes; 19, No.)

July 24 Senate votes, 52-38, to cut bill down to a right-to-vote measure by deleting Part III (Democrats voted 34, Yes; 13, No. Republicans voted 18, Yes; 25, No.)

Aug. 7 Senate passes civil-rights bill, 72 to 18. (Democrats voted 29, Yes; 18, No. Republicans voted 43, Yes; 0, No.)

27 House passes civil-rights bill in final version, 279 to 97. (Democrats voted 128, Yes; 82, No. Republicans voted 151, Yes; 15, No.)

Sept. 29 Senate passes final version, 60-15. (Democrats voted 23, Yes; 15, No. Republicans voted 37, Yes; 0, No.)

SEGREGATION

Conflict Over School Racial Integration

The Supreme Court ruled unanimously on May 17, 1954, that racial segregation in the public schools is unconstitutional under the 14th Amendment. On May 31, 1955, the Court ruled that the process of desegregation (or racial integration) should be supervised by regional Federal courts with a view to achieving the goal "with all deliberate speed."

As of the opening of schools in September, 1957, the picture was as follows:

The District of Columbia carried integration the farthest. Six border states made progress—Delaware, Kentucky, Maryland, Missouri, Oklahoma and West Virginia. Three-fourths of their 800 school districts were at least started along the path of integration, with 60,000 Negro

children attending mixed schools. All tax-supported colleges were open to Negroes.

Four states made small attempts at integration—Arkansas, North Carolina, Tennessee and Texas.

Seven states had made almost negligible attempts at integration—Alabama, Florida, Georgia, Louisiana, Mississippi, South Carolina and Virginia.

The school integration issue flared up alarmingly in Little Rock, Ark. A gradual integration plan had been formulated by the school superintendent and explained to the parents. The plan was approved by a Federal court.

Gov. Orval Faubus ordered out National Guardsmen on Sept. 4 to preserve order—according to his version—and to block entry of 9 Negro pupils in the formerly all-white Central High School of Little Rock, with approximately 2,000 students.

After a conference with President Eisenhower at his vacation place, Newport, R. I., Faubus continued to block integration. Federal Judge Ronald N. Davies, temporarily assigned to Little Rock from North Dakota to fill a judicial vacancy, rejected a school board request for delay of integration and ruled that it should proceed forthwith.

Next, Judge Davies enjoined Gov. Faubus and two National Guard officers from obstructing integration. Faubus then called off the National Guard patrol of the high school.

The following Monday, Sept. 23, a mob estimated at 800 persons, including white supremacists from outside Little Rock, formed at the Central High School. The 9 Negro pupils were spirited into the school through a side door. The mob, despite a police cordon, beat up 3 Negro news correspondents and a Negro news photographer. As the mob grew increasingly unruly, the Mayor of Little Rock ordered the Negro pupils to go home at the lunch hour. Physical violence did not touch them because of their quiet withdrawal.

President Eisenhower issued a "cease and desist" order designed to stop mob obstruction of integration. When the mob formed again the following day, he ordered the 10,000-man Arkansas National Guard into Federal service and directed the use of Federal troops if necessary to enforce the court's integration order.

More than 1,000 troops of the 101st Airborne Division moved into Little Rock on Sept. 24 by plane and truck and took up positions in the vicinity of Central High School. Next day the 9 Negro pupils—6 girls and 3 boys—returned to the school in safety. The paratroopers prevented the

formation of a mob with fixed bayonets. One man was bayoneted in the arm, and another man, who tried to grab a paratrooper's weapon, was clubbed on the head with a rifle butt.

Thereafter, the school was quiet and the Negroes attended classes without molestation by the white pupils. Gov. Faubus, on a national radio-television network, bitterly criticized the presence of Federal troops and called Arkansas "an occupied territory."

Four Southern Governors went to see President Eisenhower on Oct. 1. They thought they had an understanding with Gov. Faubus to support integration so that Federal troops could be withdrawn. The statement issued by Faubus was ambiguous, however, and Eisenhower declined to recall the troops.

The President said there was a deeper issue involved than racial integration. He said the troops were in Little Rock "to uphold the courts of the land under a law that was passed in 1792 because it was early discovered that unless we support the courts in whose hands are all our freedoms and our liberties, our protection against autocratic government, then the kind of government set up by our forefathers simply would not work."

1957

- Sept. 4 Gov. Orval Faubus of Arkansas blocks court-ordered school integration with National Guard troops.
- 5 Eisenhower telegraphs Faubus to halt his resistance to integration.
- 14 Gov. Faubus flies to Newport, R. I., to talk to Eisenhower; promises to obey court orders.
- 20 Federal court enjoins Gov. Faubus; he withdraws National Guard from Little Rock high school.
- 23 Mob in Little Rock, Ark., beats Negro reporters as 9 Negro pupils are spirited into high school.
- 24 Eisenhower sends Army troops to Little Rock to quell mob and protect school integration.
- 25 Little Rock school integrated as troops keep peace.
- 26 Gov. Faubus tells TV audience Little Rock is "occupied territory."

Information Please Almanac now proceeds to an analysis of the role of the Supreme Court in our history of constitutional government.

THE SUPREME COURT TODAY AND YESTERDAY

By

SAMUEL J. KONEFSKY

Member, School of Historical Studies of
The Institute for Advanced Study, Princeton
Now on Leave from Brooklyn College

Author of *The Legacy of Holmes and Brandeis* (1956)

SHORTLY before he was named to the Supreme Court by Franklin D. Roosevelt in 1941, the late Robert H. Jackson wrote a book about the New Deal's troubles with the judiciary which happens to contain a rather striking clue to the storm currently raging around the High Court. "The ultimate function of the Supreme Court," the future Justice told us, "is nothing less than the arbitration between fundamental and ever-present rival forces or trends in our organized society."

Jackson went on to point out that the Supreme Court conference chamber has served as a "forum" for every important issue which has divided the American people. Among the many burning questions which have come before the Justices, another student of the Court has listed "the dramatic conflicts over slavery, the contest between land and water transportation, the struggle of industrial competition against the forces of concentration, the clashing interests of workers, consumers and investors, and the claims of dissenting groups and individuals."

Once this simple fact of our history is understood, it should be apparent that, as Jackson also observed, "Conflicts which have divided the Justices always mirror a conflict which pervades society." What is perhaps far less easy to comprehend are the reasons why a judicial tribunal should have come to occupy a position which enables it to have the last word on matters of public policy. This phenomenon is all the more remarkable when one realizes

that we have borrowed most of our legal precepts from England, whose traditions and institutions are subject to the will of Parliament; more accurately, a majority of the House of Commons.

Yet even before the Constitutional Convention of 1787 met at Philadelphia to scrap the Articles of Confederation and to frame a new constitution, there were indications that a good many Americans of substance and influence were beginning to doubt the capacity of legislative assemblies to enact just or impartial laws. The early state constitutions, while professing faith in the separation of governmental powers, apportioned these powers in such a way as to make the legislature dominant.

It was probably inevitable that the law makers should have come to be blamed for the social unrest which marked the years following the American Revolution. As the antagonism between debt-ridden farmers (who controlled the legislatures in most of the states) and the men of finance and commerce grew more intense, the discontented but powerful minority turned to courts for protection against measures hostile to their interests. Thus did the search for greater economic and political stability lead to the emergence of the judiciary as a guardian of private rights, particularly property. It is no accident, therefore, that the power of courts to nullify legislation should have become, in time, an essential part of the grand scheme of constitutional checks and balances for curbing the excesses of popular majorities.

The Apology for Judicial Supremacy

One of the proudest achievements of Western civilization has been the substitution of law for force as a principle for regulating the relations between man and man and man and the state. We look to courts to settle private quarrels and to safeguard

society from those who would offend against its laws—the administration of civil and criminal justice.

But these traditional functions of courts do not explain the Supreme Court's extraordinary power in the American com-

munity. Its unique role stems from the fact that quite early in our existence under the Constitution, the Court assumed the right to control the other branches of the national government as well as the actions of the states and their local subdivisions. The social consequence of this development has never been described more clearly than in the words which Alexis de Tocqueville used more than a century ago in his classic work *Democracy in America*: "Scarcely any political question arises in the United States that is not resolved sooner or later into a judicial question."

Judicial power, American style, is nowhere specifically provided for in the Constitution itself. It has been inferred by lawyers and judges from the character and phraseology of the document. If it is at all true—as Ralph Waldo Emerson once said—that "every institution is the lengthened shadow of one man," one need not hesitate in attributing to John Marshall the chief personal responsibility for making the Supreme Court into the mighty instrument of government it has come to be. For it was John Marshall, Chief Justice for 34 years, who succeeded in establishing the Court's special role as final interpreter of the Constitution. The process by means of which it has been performing this function has come to be known as judicial review.

Contrary to what many believe, Marshall was not our first Chief Justice. John Jay was the Court's first presiding officer, but resigned in 1795 to become Governor of New York. Two other men held the position for brief periods before John Adams appointed Marshall in February, 1801, one month before turning over the Presidency to Thomas Jefferson.

A mere two years later, Marshall took advantage of a dispute over Jefferson's refusal to honor certain of Adams' appointments to proclaim that: "It is, emphatically, the province and duty of the judicial department, to say what the law is." In the course of vindicating this high prerogative of the Supreme Court, Marshall developed a conception of the Constitution which has enabled oncoming generations of Americans to adapt their fundamental charter to the vast changes wrought by time and technology. His immense service in infusing enduring vitality into the Constitution has been celebrated many times, but never more incisively or more succinctly than by Justice Felix Frankfurter when he opened the 1955 conference on "Government Under Law" marking the 200th Anniversary of the birth of the great Chief Justice:

"When Marshall came to the Supreme

Court, the Constitution was still essentially a virgin document. By a few opinions—a mere handful—he gave institutional direction to the inert ideas of a paper scheme of government. . . . There can be little doubt that Marshall saw and seized his opportunities to educate the country to a spacious view of the Constitution, to accustom the public mind to broad national powers, to counteract the commercial and political self-centeredness of States. He was on guard against every tendency to continue treating the new Union as though it were the old Confederation. He imparted such a momentum to his views that the Court and eventually the country were moved in his general direction, beyond his own time and into our own."

Marshall's opinion in the famous 1803 case of *Marbury v. Madison* asserted the right of the Supreme Court to hold acts of Congress unconstitutional, and in 1810 he enlarged the Court's power to include the veto of state legislation. To Marshall the crucial problem was how to enforce the "supremacy" of a written constitution, regarded by him to be the "greatest improvement on political institutions." The Constitution embodies the "original and supreme will" of the people. That will has been expressed in the form of certain principles designed to be both "fundamental" and "permanent" and therefore binding on the officials whom they restrict.

"Certainly, all those who have framed written constitutions," Marshall insisted, "contemplate them as forming the fundamental and paramount law of the nation, and consequently, the theory of every such government must be, that an act of the legislature, repugnant to the constitution, is void." It would be "immoral" and "worse than solemn mockery" if judges, who take an oath to defend the Constitution, were to refuse to make it known that they considered the legislation under attack to violate the Constitution, "the supreme law of the land."

The United States Constitution embodies three fundamental limitations upon the exercise of governmental power. These are the division of authority between the national government and the states creating the Federal Union, the separation of powers among the three departments of the national government, and the guarantees of individual rights. It is to be noted that the Federal judiciary is established as an equal and coordinate branch. The independence of the judges is made secure by giving them life tenure—service "during good behavior," the Constitution says—and by the provision forbidding Congress to reduce their salaries.

Umpiring the Federal System

In Marshall's time, the states and the nation were still looked upon as mutually hostile governments whose antagonisms might dissolve the Union. The Supreme Court was to serve as the ever active but impartial umpire between them. Marshall's basic strategy for maintaining the "more perfect Union" was to interpret liberally the powers of the national government. Speaking of possible conflicts between the two governments, Marshall warned that they "must be decided peacefully, or remain a source of hostile legislation, perhaps of hostility of a still more serious nature; and if it is to be so decided, by this tribunal alone can the decision be made. On the Supreme Court of the United States has the constitution of our country devolved this important duty."

When one thinks of the Civil War and the tragic collapse of the will to accept peaceful adjustment of inter-governmental conflicts, Marshall's admonition takes on the character of dramatic foreshadowing. The warning was sounded in

his historic opinion in *McCulloch v. Maryland*, decided in 1819—an opinion which deprived the States of any right to interfere, by taxation or otherwise, with the activities of agencies created by the Federal government. It was in this case that the Court also upheld the authority of Congress to charter banks, though there was no word on the subject in the Constitution. The Court justified this sweeping expansion of national power by relying on the doctrine of incidental or implied powers—the doctrine that Congress is free to enact measures deemed "necessary and proper" for putting into practical effect the powers expressly delegated to it in the Constitution. Marshall's now familiar assertion—"we must never forget, that it is a *Constitution* we are expounding"—continues to be quoted by jurists who believe, as he did, that the Constitution of the United States was "intended to endure for ages to come, and, consequently to be adapted to the various crises of human affairs."

Self-Imposed Limits

Even before Marshall had formulated his formidable apology for judicial review, the Supreme Court had begun to evolve principles of self-restraint which have proved to be exceedingly useful in keeping intact the great power he claimed for it. Unlike the highest tribunals in some of the states, the Supreme Court of the United States will not hand down so-called advisory opinions—opinions which merely speculate on the constitutionality of pending measures and have no binding effect. When a President wishes to have legal advice of an official nature, he requests his Attorney General to prepare an opinion on the subject in question.

The Court restricts itself to litigation. It will decide only actual "cases" or "controversies" and not disputes over hypothetical matters. "The Court's only power is to decide lawsuits between adversary litigants with real interests at stake."

The Supreme Court refrains from pass-

ing on "political questions," questions it regards to be incapable of judicial determination and which are better handled by Congress or the President. It was on this theory that the Court refused to determine the constitutionality of the failure of Illinois to reshuffle congressional districts in accordance with the latest census. While the reasons for treating certain problems as political are not always made explicit, it may be assumed that the motivation is not to hurt the Court's standing by issuing decrees which are likely to be defied. Lacking the power of the purse and the sword, the Justices are not unaware of the extent to which the Court's power and prestige depend upon the support by the other branches of the government and upon public opinion generally. After all, they know of Andrew Jackson's celebrated taunt: "John Marshall has made his decision, now let him enforce it."

Jurisdiction, Size and Compensation

Article III of the Constitution vests the judicial power of the United States in "one supreme Court" and in such "inferior Courts" as Congress may establish. Only the Supreme Court, therefore, may be said to owe its existence to explicit provision of the Constitution. However, both its size

and appellate jurisdiction are subject to regulation by Congress. In order not to risk having the Court hold the Reconstruction Acts invalid, Congress deliberately cut down the Court's jurisdiction in 1869 in such a way as to keep it from deciding a case which had already been argued.

The right of Congress to do this was upheld by the Court.

Whatever might have been said against it on moral grounds, President Roosevelt's 1937 plan to "pack" the Supreme Court by enlarging its membership could not have been attacked as unconstitutional. Its size has been changed by Congress several times, but since 1869 the Supreme Court has consisted of nine members—a Chief Justice and eight Associate Justices. Justices are appointed by the President and must be confirmed by a majority vote of the Senate.

Except for the fact that he is the

Court's administrative officer—presiding at all of its public sessions and at the conferences of the Justices—the position of the Chief Justice of the United States (to call him by his official title) is no different from that of his colleagues. "His actual influence will depend upon the strength of his character and the demonstration of his ability in the intimate relations of the judges"—is the way Charles Evans Hughes once described the ultimate source of a Chief Justice's authority. For his extra burdens, the Chief receives \$500 more than the Associate Justices. Their present salary is \$35,000 a year.

Access to Federal Courts

Basically, whether or not a case falls within the Supreme Court's province depends on the subject matter of the controversy or who the litigants are. *"The judicial power shall extend to all cases, in Law and Equity, arising under this Constitution, the Laws of the United States, and treaties made, or which shall be made, under their Authority."* After making this general grant of power to the judicial branch of the national government, Article III of the Constitution proceeds to confer jurisdiction on Federal courts in two classes of cases. In the first category, whether or not a case falls within their jurisdiction depends on the subject matter of the litigation, regardless of who the litigants or parties happen to be. For example, if the outcome in a case hinges on the interpretation of a provision of the Constitution, "Laws of the United States" or a treaty, it raises a "federal" question and therefore may potentially reach the Federal courts. In the second class of cases, the jurisdiction of

Federal courts may be invoked because of the nature of the parties. Cases between two or more states, suits in which the United States itself is a party and cases between citizens of different states—all illustrate the latter reason for access to the Federal courts.

So far as the Supreme Court itself is concerned, it is granted both original and appellate jurisdiction. Its "original jurisdiction" is limited to cases "affecting" ambassadors, other public ministers and consuls and those in which a State is a party. Such cases can go directly to the Supreme Court without first having to be heard by any other tribunal, federal or state. But of course in the exercise of its appellate jurisdiction, the Supreme Court can review decisions of a state's highest court or of lower Federal courts which involve a "federal" question or concern litigants whom the Constitution assures the right to have their claim determined by a Federal court.

Politics and Appointments

No less illustrious a jurist than Oliver Wendell Holmes—who was put on the Court by Theodore Roosevelt after serving for twenty years on the Supreme Judicial Court of Massachusetts—was apparently convinced that the experience in practical affairs gained from a life in politics was a good preparation for service on the Supreme Court. "I was driven years ago to the conclusion," he wrote to Harold J. Laski in 1925, "that political considerations had not hurt the character of appointments here."

Some of the most eminent of the Court's members have ascended the Bench without having served on any Federal or state court before—among them John Marshall, Joseph Story, Roger B. Taney, Samuel F. Miller, Charles Evans Hughes,

Louis D. Brandeis. Justice Frankfurter's almost life-long study of the background of Supreme Court personnel has led him to conclude that, "the correlation between prior judicial experience and fitness for the functions of the Supreme Court is zero." Perhaps the least reliable guide to the future conduct of a Justice is his political affiliation. Woodrow Wilson gave the country both Louis D. Brandeis—who, as a judge, continued to speak as an apostle of enlightened liberalism—and James C. McReynolds, who became a symbol of judicial reaction. And we know how bitterly disappointed Theodore Roosevelt was when he discovered that Justice Holmes did not at all share his own trust-busting zeal.

The Court's Working Habits

The process by which the Supreme Court does its work may be described as essentially an intellectual and deliberative one. At the behest of the Court itself, Congress, in 1925, diminished its jurisdiction in order to enable it to give closer attention to questions of public importance. This was accomplished by allowing it greater discretion in the selection of cases to be heard.

The usual line of appeal to the Supreme Court is either from one of the eleven United States Courts of Appeals or the highest court of a state. One wishing to carry his case to the nation's top tribunal files a writ of appeal or a petition for certiorari. In but a small number of the cases which come before the Supreme Court, are litigants entitled to be heard as a matter of right—by means of a writ of appeal. With respect to most of the business which it handles, the Court itself decides what cases it will hear. Most petitions for certiorari are denied, but a request will be granted even if only four Justices deem a case worthy of consideration.

In the ordinary case each side has one hour for oral argument. Occasionally the time limit is extended. Thus, the Justice Department and the defense were each given two hours when the Court met on July 8, 1957, to hear the case growing out of the Government's decision to turn William Girard over for trial in a Japanese court.

Even the most distinguished attorney has no assurance that he will be permitted to present his case as he had planned it. He must be prepared for interruptions in the form of questions from the Justices. The Supreme Court rules tell him that the Court frowns upon "any oral argument that is read from a prepared text." Counsel appearing before the Court are expected to "emphasize and clarify" the contentions made in their written briefs. Any lawyer who has been a member of the bar

of the highest court of his state for at least three years can be admitted to practice before the United States Supreme Court when "indorsed" by two attorneys already practicing before it.

When the Court is not in recess, it meets at 12 o'clock, sharp, rises for a half-hour lunch at 2 o'clock and resumes at 2:30 for two more hours. At the end of Earl Warren's second year as Chief Justice, it was announced that the conferences of the Justices—which customarily were held on Saturday—would henceforth be held on Friday. At these conferences, the cases which were argued during the week are discussed and a vote taken. The Chief Justice presents the case, and then his colleagues, usually in order of seniority, give their views. However, when the time for decision arrives, the junior member votes first and the Chief Justice last. The Chief Justice assigns the writing of opinions, and he may always take for himself the privilege of speaking for the Court. When the Chief is in the minority, the senior Associate Justice on the majority side assigns the writing of the opinion. Any member of the Court is free to express his disagreement by submitting a dissenting opinion.

In the lectures on the Supreme Court which he was preparing at the time of his death in 1954, Justice Jackson has shared with us an intimate glimpse of the Court's working habits. His candid picture deserves to be recalled: "The time devoted at conference to argued cases is inadequate for detailed deliberation and results, more or less, in a canvass of impressions with the understanding that a vote on any case is tentative and on later consideration may be changed. And not infrequently the detailed study required to write an opinion or dissent, will lead to a change of a vote or even to a change of result. If there is further conferring, it is unofficial, usually between two or more Justices of like mind in the particular case."

The Storm Center of American Politics

Speaking about the Supreme Court in 1913, Justice Holmes had occasion to observe, "We are very quiet there, but it is the quiet of a storm center, as we all know." The ominous note was really in the nature of a prophecy of the inevitable. Since then the Court has confined itself almost exclusively to issues of public concern, so that controversies over its decisions are bound to occur even more often.

We are living through such a period of popular clamor over the trend of judicial behavior, and the chief source of agitation is without doubt the 1954 decision on segregation in the public schools. A former member of the Court—Governor James F. Byrnes of South Carolina—has called for measures to "curb" the Court, and the Declaration of Constitutional Principles signed by ninety-six Southern members of Congress on March 11, 1956

accused it of the "abuse of judicial power." What has the Court done?

Equal Protection and Racial Discrimination

Aware that as the Constitution then stood there was nothing to prevent the Southern States from discriminating against the former slaves, Congress proposed constitutional amendments as soon as the Civil War was over which were designed to keep the South from nullifying the victory won on the battlefield. In 1865 the Thirteenth Amendment abolished slavery, and three years later the Fourteenth Amendment was added. One of the most important provisions in the Fourteenth Amendment forbids a State "to deny to any person within its jurisdiction the equal protection of the laws." However, once normal conditions returned in the decades that followed, Southern lawmakers began to display considerable ingenuity in devising ways and means for maintaining "white supremacy."

Aside from the efforts to sterilize the Negro's political influence—contrary to the Fifteenth Amendment's guarantee of the right to vote—their chief aim was to prevent mingling of the races in the ordinary activities of life in the community, especially travel, recreation and amusements. Through the Civil Rights Act of 1875, Congress undertook to stop discrimination on the basis of race or color in such public accommodations, but the legislation was struck down by the Supreme Court in 1883 on the ground that the Fourteenth Amendment did not authorize Congress to regulate discrimination practiced by private individuals. The prohibitions in the Amendment were said to apply to discrimination resulting from state law.

"Separate but Equal"

Yet when the States began to adopt regulations instituting the very type of discrimination which Congress had sought to outlaw, the Supreme Court allowed them to stand. *Plessy v. Ferguson*, decided in 1896, is the case in which the Court sustained the right of a Southern State to segregate the races, provided "separate but equal" facilities were made available. Involved in this case was a Louisiana law requiring separate accommodations on railroads. The legislation was challenged as a denial of equal protection of the laws.

Over the vigorous objections of Justice John Marshall Harlan, the lone dissenter

in the case, the Supreme Court held that the Louisiana statute was a reasonable exercise of the State's authority to maintain law and order in the community. According to the majority, the Fourteenth Amendment merely required the equality of the races "before the law" but was not intended "to abolish distinctions based upon color, or to enforce social, as distinguished from political equality." In view of the criticism that the 1954 case which overturned *Plessy v. Ferguson* was based upon psychological theory, it may be well to recall a revealing observation in the 1896 opinion by Justice Brown. Referring to the objection against the forced separation of the races, Brown remarked: "We consider the underlying fallacy of the plaintiff's (Plessy's) argument to consist in the assumption that the enforced separation of the two races stamps the colored race with a badge of inferiority. If this be so, it is not by reason of anything found in the act, but solely because the colored race chooses to put that construction upon it."

In the opinion of Justice Harlan, the separation of Negroes on the basis of their race imposed on them "a badge of servitude" and was entirely inconsistent with the purposes of the Civil War Amendments. He insisted that "our Constitution is color-blind" and was blunt enough to say: "The thin disguise of 'equal' accommodations for passengers in railroad coaches will not mislead anyone, nor atone for the wrong this day done."

The "wrong" of which Justice Harlan spoke was, of course, the whole system of segregation, and in bestowing its blessings upon it the Supreme Court no doubt contributed to the survival of "Jim Crow" in Southern society. It is ironic, indeed, that by way of defending the separation of passengers, Justice Brown cited the existence of segregated schools in the District of Columbia and even in communities outside the South. When such segregation came to be challenged before the Supreme Court in later years, the Court relied on *Plessy v. Ferguson* as precedent for upholding the legality of segregated education.

Segregation in Higher Education

The first major successes in the resistance to segregated schools were in the field of higher education, most notably in 1950, when the Court showed that it was willing to consider "intangible" factors in measuring equality. Chief Justice Fred M. Vinson, a Kentuckian, led the Court in holding that Texas could not require Negro students to attend a newly-estab-

lished segregated law school, Vinson saying that to compare this law school with the one at the University of Texas it was necessary to consider "those qualities which are incapable of objective measurement but which make for greatness in a law school." In another case decided at the same time, the Court held that a Negro working toward his doctorate in the School of Education at the University of Oklahoma, was not to be set apart or discriminated against in other ways in such places as class-rooms, library and cafeteria. To ascertain whether the Negro student was receiving equal treatment, Vinson declared, one must reckon with such factors as "his ability to study, to engage in discussion and exchange views with other students, and, in general, to learn his profession."

The 1954 Segregation Decision

These decisions served to intensify the drive against segregation in primary and secondary schools. But the big question they left unanswered was whether the Supreme Court was ready to overrule *Plessy v. Ferguson*. The answer came on May 17, 1954 in the opinion by Chief Justice Warren holding that "in the field of public education the doctrine of 'separate but equal' has no place." Referring to the subtle psychological factors discussed by Vinson in the cases concerned with graduate and professional education, the Chief Justice said: "Such considerations apply with added force to children in grade and high schools. To separate them from others of similar age and qualifications solely because of their race generates a feeling of inferiority as to their status in the community that may affect their hearts and minds in a way unlikely ever to be undone."

When the case was argued for a second time some months earlier, most of the discussion was devoted to the question as

to whether the Fourteenth Amendment was intended to prevent the establishment of segregated schools. The Chief Justice now revealed that this exposition as well as their own study of the problem had only served to convince the Justices that the evidence on the subject was at best "inconclusive." Neither was the Court willing to "turn the clock back" to 1896. To determine whether segregation of the races at school denies to Negroes the equal protection of the laws, it was essential to bear in mind the fact that in our highly complex and technological society public education has become, for nearly all Americans, absolutely indispensable to the enjoyment of full equality of opportunity. The practical question was, therefore: What kind of education were Negro children receiving?

Chief Justice Warren made it plain that regardless of the state of "psychological knowledge" in 1896, the Supreme Court was now prepared to accept the findings of modern social scientists. He quoted with approval statements in the lower courts which maintained that the separation of white and Negro children in the public schools tends to retard the full development of the Negro children and to deprive them of the advantages they would have in racially integrated schools. A year later the Court issued an enforcement decree directing the Federal district courts to take such steps as might be necessary to achieve the integration of the Nation's public schools "with all deliberate speed."

No one can doubt that the Justices were aware of the explosive character of the problem and of the far-reaching consequences of their decision. Surely the opportunity afforded for extensive argument and re-argument is proof enough of the great care and of the keen sense of responsibility with which they approached their delicate task. Perhaps the Justices were inspired by some such call to courage as is implicit in a familiar challenge of Justice Brandeis: "Sometimes, if we would guide by the light of reason, we must let our minds be bold."

Old Conflict—New Issues

In the years which culminated in the New Deal's challenge to the Supreme Court, the main legal problem confronting our political leaders was to find constitutional support for positive action by government in furtherance of economic recovery and social welfare. Caught between old theories of limited governmental

power and demands for unprecedented national action for a people in distress, dominant Supreme Court majorities remained hostile to the new forces. It is now exactly twenty years since the Court itself staged the about-face which saw the validation of such important measures as the Wagner Act and the Social Se-

curity Act. As the result of this "revolution" in constitutional doctrines, the resources for government regulation of the economy and its promotion of public welfare generally are practically limitless.

Today, the battle line has shifted from a struggle to vindicate the powers of government to concern over their abuse. It is because of some of its decisions in so-called civil rights cases that the Supreme Court is again the target of wide-spread criticism. The term that ended on June 25, 1957 offers some excellent examples of the Court's current troubles.

The Jencks Case and F.B.I. Files

Clinton E. Jencks, president of one of the locals in the International Union of Mine, Mill and Smelter Workers, was convicted for filing a false non-Communist affidavit with the National Labor Relations Board under the procedures of the Taft-Hartley Act. The two key witnesses against him were Harvey Matusow and John W. Ford, F.B.I. informants within the Communist Party paid to make oral and written reports to the Bureau. Jencks asked to see these documents in the hope of breaking down the credibility of his chief accusers by showing inconsistencies between their testimony at the trial and their previous reports. The trial judge denied this motion.

Justice William J. Brennan led a majority of his colleagues in holding that Jencks was entitled to examine these reports. The opportunity to do so in a criminal case might be essential to the preparation of an adequate defense. The heart of the Court's opinion is probably contained in this sentence: "We now hold that the petitioner (Jencks) was entitled to an order directing the Government to produce for inspection all reports of Matusow and Ford in its possession, written and when orally made as recorded by the F.B.I., touching the events and activities as to which they testified at the trial."

In a brief but sharp dissent, Justice Clark charged, in effect, that the Court was endangering national security. "Unless the Congress changes the rule announced by the Court today," he protested, "those intelligence agencies of our government engaged in law enforcement may as well close shop for the Court has opened their files to the criminal and thus afforded him a Roman holiday for rummaging through confidential information as well as vital national secrets. This may well be a reasonable rule in state prosecutions where none of the problems of foreign

relations, espionage, sabotage, subversive activities, counterfeiting, internal security, national defense, and the like, exist, but any person conversant with federal government activities and problems will quickly recognize that it opens up a veritable Pandora's box of troubles."

The alarm sounded by Justice Clark on June 3rd was immediately echoed by powerful voices in and out of the Halls of Congress. In the closing hours before it adjourned on August 30, Congress enacted a compromise bill which authorizes trial judges, and not the prosecution, to determine which items in confidential files may be made available to the defense.

The Watkins Case and Legislative Investigations

It would be difficult to determine which decision created greater consternation on Capitol Hill—the ruling in the *Jencks* case or the pronouncement in the *Watkins* case, two weeks later, that "there is no Congressional power to expose for the sake of exposure." John T. Watkins was for many years an official of the Farm Equipment Workers International Union, later merged into the United Electrical, Radio and Machine Workers. In the spring of 1954, he was summoned before the House Committee on Un-American Activities when it was looking into the infiltration of Communists into the labor movement. He informed the Committee that he would not plead the Fifth Amendment but that he felt that certain matters were outside its jurisdiction. "I do not believe," Watkins told the Committee, "that any law in this country requires me to testify about persons who may in the past have been Communist party members or otherwise engaged in Communist party activity but who to my best knowledge and belief have long since removed themselves from the Communist movement." For refusing to name former associates, he was prosecuted and convicted for contempt of Congress.

Chief Justice Warren was the Supreme Court's spokesman when it reversed Watkins' conviction. Justices Burton and Whitaker did not participate in the case, and only Justice Clark dissented. Noting that the investigations into threats of subversion in the decade following World War II "involved a broad-scale intrusion into the lives and affairs of private citizens," the Chief Justice strongly implied that our lawmakers seem to have forgotten that a legislative inquiry must not degenerate into an "inquisition" but must be related to the needs of lawmaking. The authoriza-

tion under which the House Committee on Un-American Activities operated was so broad and undefined that the Committee was able to roam too far afield, and witnesses did not always know just what the Committee was seeking to learn from them.

Since Watkins was not given "a fair opportunity" to determine whether he was within his rights in refusing to answer certain of the Committee's questions, he had been denied "due process of law" in violation of the Fifth Amendment. The Chief Justice emphasized that there was "no general authority to expose the private affairs of individuals when the inquiry is unrelated to legitimate legislative business." But from a constitutional standpoint, probably the most significant part of his opinion is the assertion that, "the First Amendment may be invoked against infringement of the protected freedoms by law or by lawmaking."

It is clear from the debate between the Chief Justice and Justice Clark that a major issue dividing them was the propriety of having the Court dictate to Congress how it should conduct itself. Chief Justice Warren sought to meet the inevitable criticism by declaring that the Court cannot "abdicate the responsibility placed by the Constitution upon the judiciary to insure that the Congress does not unjustifiably encroach upon an individual's right to privacy nor abridge his liberty of speech, press, religion or assembly." And what must have rankled most of all was his comment: "Investigations conducted solely for the personal aggrandizement of the investigators or to 'punish' those investigated are indefensible."

In his vehement dissent, Justice Clark accused the majority of a "mischievous curbing of the informing function of Congress" and of substituting "the judiciary as the grand inquisitor and supervisor of congressional investigations." He contended that the Court's objection to what it called the "tremendous latitude" allowed the House Committee on Un-American Activities was unrealistic. All congressional committees are given power in extremely broad terms. Justice Clark insisted that the restrictions imposed by the majority upon the Committee system of Congress would "cripple the system beyond workability."

An Important Free Speech Case

It must not be assumed that the Court is always divided in civil rights cases, though the questions they raise are often

difficult and close. When *Butler v. Michigan* was decided in February, Justice Frankfurter was able to speak for a unanimous Court on a highly controversial issue concerned with the freedoms of the First Amendment. At stake was the power of state and local governments to engage in the censorship of books.

Butler, a Detroit book dealer, was convicted for selling to a police officer a paperback copy of John Griffin's *The Devil Rides Outside*, in violation of a Michigan law which defines as obscene any book or other publication which might tend "to incite minors to violent or depraved or immoral acts," or might tend "to the corruption of the morals of youth."

Michigan's attempt to judge literature by the test of whether it was suitable for children was disposed of by Justice Frankfurter in a few terse sentences: "The State insists that, by thus quarantining the general reading public against books not too rugged for grown men and women in order to shield juvenile innocence, it is exercising its power to promote the general welfare. Surely, this is to burn the house to roast the pig. . . . We have before us legislation not reasonably restricted to the evil with which it is said to deal. The incidence of this enactment is to reduce the adult population of Michigan to reading only what is fit for children. It thereby arbitrarily curtails one of those liberties of the individual, now enshrined in the Due Process Clause of the Fourteenth Amendment, that history has attested as the indispensable conditions for the maintenance and progress of a free society."

Censors of Economic Policy

The Supreme Court's authority to interpret the meaning of the Constitution is not the only source of its power in our society. Its construction of legislation and administrative regulations can have far-reaching effects. A rather spectacular instance is *United States v. E. I. du Pont de Nemours and Company*, decided on June 3, 1957. It is one of those rare occasions when an important case was decided by less than a majority of the members of the Court. Justices Clark, Harlan and Whittaker took no part in the case and Justices Burton and Frankfurter dissented. The opinion for the Court delivered by Justice Brennan had the support only of Chief Justice Warren and Justices Black and Douglas.

Between 1917 and 1919, du Pont acquired a 23 per cent stock interest in the General Motors Corporation. This was

done in order to insure a continuing market for the company's finishes and fabrics. In 1949 the Justice Department brought a suit asking the courts to compel du Pont to dispose of some of its General Motors stock, complaining that through its relationship with General Motors, du Pont had secured an illegal preference over its competitors in the sale of its products to General Motors. All of this was going on, it was alleged, in violation of Section 7 of the Clayton Act, which forbids a corporation to acquire the stock of another where the effect is to substantially lessen competition between the two corporations or tends to create a monopoly in "any line of commerce."

After relating a detailed and fascinating story of the policies and maneuvers by means of which du Pont became General Motors' principal supplier of automotive finishes and fabrics, Justice Brennan concluded that it was quite obvious that du Pont's "commanding position" was achieved not through competition but because of its stock acquisition. As he said,

"The fact that sticks out in this voluminous record is that the bulk of du Pont's production has always supplied the largest part of the requirements of the one customer in the automobile industry connected with du Pont by a stock interest. The inference is overwhelming that du Pont's commanding position was promoted by its stock interest and not gained solely on competitive merit."

Justice Burton, who filed a lengthy and meticulous dissent, was not convinced; he came to a quite different conclusion from the mass of evidence in the case. To him it was clear that General Motors purchased du Pont paint and fabrics solely because of their superior quality and not because of any pressure due to du Pont's stock interest in the corporation. Objecting that "du Pont is being penalized rather than rewarded for contributing to technological advance," the Justice strongly implied that his colleagues had been led into error because of their aversion to bigness in business.

A Tradition of Judicial Independence

By the time Franklin D. Roosevelt was elected to a fourth term, he had placed on the Supreme Court eight Associate Justices and had elevated Harlan Fiske Stone, originally appointed by Calvin Coolidge, to be Chief Justice. A court controlled by men owing their office to the same President, it was assumed by some, would sooner or later become a rubber stamp for the Administration.

Within a few years, however, all could see that no such harmony or peace reigned within the Roosevelt Court. The close votes and sharp dissents which began to be registered made it obvious that the New Deal Justices differed with each other on many fundamental issues. In the 1943 term, for the first time in the Court's history, the cases in which the Justices were divided outnumbered those decided by unanimous vote.

The incidence or degree of disagreement among the members of the Supreme Court naturally fluctuates from year to year. But despite changes in personnel, the basic pattern which finds expression in the statement of conflicting views has not altered. That this is so is due both to the nature of our Constitution and to the character

of the problems which the Supreme Court seeks to resolve.

It is quite impossible to know what the great clauses of the document mean today by merely reading them. The general phraseology in which they are couched not only invites interpretation but opens the door to wide differences of opinion as to their purport. Moreover, the cases handled by the Supreme Court touch the deepest social, economic and political issues of our diverse society.

Nine independent men of varying backgrounds and attitudes, who are sworn to uphold the Constitution as they see it, should not be expected to speak with one voice on debatable questions. A recent comment by Justice Frankfurter is as good an answer to the critics of judicial discord as one can hope to find: "If the materials on which judicial judgments must be based could be fed into a machine so as to produce ineluctable answers, if such were the nature of the problems that come before the Supreme Court and such were the answers expected, we would have *I.B.M.* machines doing the work instead of judges."

Impeachments

U. S. Constitution, Article I, Section 2.

The Senate shall have the sole Power to try all Impeachments. When sitting for that Purpose, they shall be on Oath or Affirmation. When the President of the United States is tried, the Chief Justice shall preside: And no Person shall be convicted without the Concurrence of two thirds of the Members present.

Judgment in Cases of Impeachment shall not extend further than to removal from Office, and disqualification to hold and enjoy any Office of honor, Trust, or Profit under the United States: but the Party convicted shall nevertheless be liable and subject to Indictment, Trial, Judgment and Punishment, according to Law.

Federal Impeachments

Source: Congressional Directory.

The Senate has sat as a court of impeachment in the following cases:

WILLIAM BLOUNT, Senator from Tennessee; charges dismissed for want of jurisdiction, January 14, 1799.

JOHN PICKENS, Judge of the U. S. District Court for New Hampshire; removed from office March 12, 1804.

SAMUEL CHASE, Associate Justice of the Supreme Court; acquitted March 1, 1805.

JAMES H. PECK, Judge of the U. S. District Court for Missouri; acquitted Jan. 31, 1831.

WEST H. HUMPHREYS, Judge of the United States District Court for the middle, eastern, and western districts of Tennessee; removed from office June 26, 1862.

ANDREW JOHNSON, President of the United States; acquitted May 26, 1868.

WILLIAM W. BELKNAP, Secretary of War; acquitted Aug. 1, 1876.

CHARLES SWAYNE, Judge of the United States District Court for the northern district of Florida; acquitted Feb. 27, 1905.

ROBERT W. ARCHBOLD, Associate Judge, United States Commerce Court; removed from office January 13, 1913.

GEORGE W. ENGLISH, Judge of the U. S. District Court for the eastern district of Illinois; resigned office November 4, 1926; impeachment proceedings dismissed.

HAROLD LOUDERBACK, Judge of the U. S. District Court for the northern district of California; acquitted May 24, 1933.

HAROLD L. RITTER, Judge of the U. S. District Court for the southern district of Florida; removed April 17, 1936.

BREAKTHROUGHS IN SCIENCE

By

WILLY LEY

With an Introduction by

HUBERT M. EVANS

Professor of Natural Science
Teachers College, Columbia University

INTRODUCTION

The intellectual streams which constitute the worlds of science move ahead with amazing speed; amazing even to the working scientists. Scientific knowledge accumulates rapidly and the rate of increase is geometrical rather than arithmetical. It has been estimated that throughout the world around 30,000 scientific articles appear in journals every week. The reports in today's scientific journals, while presently only of interest to the scientists, provide the raw material, the groundwork for tomorrow's dramatic developments.

What is the citizen to do in the face of this avalanche of new knowledge, new ideas, new developments? There would be no need to raise this question were it not for the tremendous social, political, economic, and educational importance of science and technology. This surely is the inescapable fact in modern life throughout the world.

For the non-scientist—the parent, the citizen—the situation is not quite as impossible as it may appear at first glance. Within each scientific stream—atomic physics, bio-chemistry, genetics, electronics, radio-astronomy—there exists a relatively stable core of ideas and concepts. You may be confused by the pronouncements of the atomic physicist regarding the nature of the atom but you do have the concept, *atom*. This required more than 2,000 years for historic man to incorporate into systematic thought. The notion of an inertial framework may seem foreign, even esoteric. But again, the basic concept, *inertia*, is widely understood, at least on an elementary level. To clarify this concept took the genius of a Galileo and a Newton. The chemistry of plastics, a scientific and technical world in itself, is fundamentally based on the concept of the *molecule*, a

concept with which most adults, and children for that matter, are familiar.

The point to be noted here is that the culture in which we live is in possession of many of the basic concepts which underlie modern scientific developments. The problem is to re-interpret, modify and build on what we know. There are likely to be discrepancies in the scientific ideas we learned in school and college. At least some of these discrepancies must be removed if we are to come close to understanding modern developments in science.

The task which faces the present-day parent, while difficult, is not impossible. Excellent and helpful materials are available in books, the press, magazines and now in *Information Please Almanac*, which you will subsequently experience. Our children are exposed daily to modern scientific ideas and developments in school and through the mass media. To them, these ideas do not seem strange or esoteric for after all this is the world into which our children were born. It is the parents' world, too. "Keeping up with science" takes on the character of a mandate, a relatively new responsibility for the modern parent. That is, if our children are to receive adequate guidance during the period of their formal education and preparation for a career.

An ancient Greek philosopher observed that you cannot step into the same river twice. As Willy Ley leads you into the river of modern scientific thought and achievement do not expect to find exactly the same river you tried to "swim" in during your school and college days. But there is enough of the "old" to keep you afloat until you grasp the "new."

BREAKTHROUGHS IN SCIENCE

By Willy Ley

ATOMIC ENERGY

(Mr. Ley, the author of this section in the Information Please Almanac, has recently been appointed to a professorship at Fairleigh Dickinson University in New Jersey.)

DURING the four decades since the end of the first World War more scientific discoveries have been made and applied to daily life than in any preceding period. The most important of these discoveries was, of course, the release of atomic energy. Although its first application was a military one, the release of atomic energy is not purely a military matter.

No other scientific discovery or engineering accomplishment has exerted, and will continue to exert, such profound influence in literally every field, from economic planning to political thought and medical research.

In popular opinion, it seems, all atomic energy began with a letter written by a refugee scientist named Albert Einstein to the president of his adopted country, Franklin Delano Roosevelt. The letter was dated August 2, 1939. We'll quote portions from it later when the contents will be more understandable to the reader. Naturally the contents of this letter were not made public then; its existence was not even mentioned.

Groundwork Already Done

But while this letter was the beginning of a many-billion dollar project it did not mark the beginning of "atomic energy." In fact all the groundwork was done by that time; if it had not been, the letter could not have been written.

The rundown of the scientific thinking and the research which led to the release of atomic energy begins with the beginning of the current century.

When the twentieth century began physicists and chemists entered it with a firm conviction but also with a faint doubt. The firm conviction was that all matter consisted of smallest particles of a given and fairly small number. If somebody, say in 1902, had asked a professor of physics to explain this statement a little more he might have used a grain of ordinary table salt as an example. "If I crush this grain of salt with a spoon," he would have

said, "I'll get a fine powder composed of much smaller grains. But every tiny grain would still be salt. Under a microscope and with proper equipment, such a tiny grain might be crushed into still finer pieces, but each microscopic piece would still be salt. Finally, I would get the smallest bit of salt which is possible, a single molecule." ("Molecule" actually means "little bundle," it had been coined by the Italian chemist, Count Amadeo Avogadro.) "Nothing can be done to such a single molecule, still salt, by physical means anymore. But it can still be taken apart chemically; it then ceases to be salt and we would get one particle each of the metal sodium and of the gas chlorine. These are atoms, the smallest possible portion of the chemical elements."

The professor would have added that there are only 92 such chemical elements but not all of them have been discovered at the moment. At any event the smallest possible particle of an element was the atom.

That was the firm (and correct) conviction. The faint doubt was whether the name for this smallest possible particle was correct. The word atom was derived from the Greek *atomos* which means "indivisible." Maybe the atom was not as indivisible as its name said, possibly there was an analogy to the molecule of sodium chloride, or salt, which, when taken apart, ceased to be salt.

The Fogged Plates

The reason for this doubt about the indivisibility of the atom was an observation made by the Frenchman, Antoine Henri Becquerel. He had kept a compound of something called uranium in the same desk drawer with unexposed photographic plates and the plates had been fogged. It could only be the uranium which had done it. But how? This particular discovery, the first time atomic energy was noticed (1896), led to the discovery of two new elements by Pierre and Marie Curie, namely, polonium and, somewhat later, radium. And radium, when kept enclosed, produced a gas

which seemed to be helium. It was clear that the very heavy atoms did not stay unchanged, as a good atom should. This implied that the heavy atoms broke apart, so the atoms, in turn, had to have building blocks.

The first fact gathered was that one could do nothing about it. The radium atoms did break apart at a given rate. They could not be prevented from doing this by heat or cold or pressure or by electricity or magnetism. Nor could their breaking up be accelerated by any of these means. The rate of break-up was given. All one could do was to ascertain the "half-life" and it might as well be explained at this point why scientists, when it comes to radioactive substances, speak about the half-life. Why not the life? The reason is rather similar to the reason why you can speak of the average age of a population but not the age of the population.

Imagine that you have ten billion radioactive atoms of the same kind. They are slowly breaking apart, at a set rate, one now, another one next second. A million years later, say, only five billion atoms of the original kind are left; the others have turned into something else which probably is not radioactive and therefore stable. After two million years you have only two and a half billion of the original atoms left. After three million years their number has dwindled to one and a quarter billion, after four million years to 625 million, after five million years to 312 million and so forth. Even after many millions of years there would still be some of the original atoms left and, of course, the example could have started with a hundred billion radioactive atoms. One cannot, therefore, speak of a life-time, it is meaningless. But one can put down after what time half of the atoms will be gone; therefore it is the half-life which is important.

Once reasoning had gone to this point the geologists had a brand-new idea. So this uranium, the physicists say, has a half-life of 4,700,000,000 years, then it turns, probably through a number of intermediate stages, into lead. At one point helium is produced in the process. If this is so then the percentages of uranium, of helium and of lead in rocks should tell us how old these rocks are. There were great practical difficulties—especially since helium, being a gas, will leak out—but the dating of rocks by their natural radioactivity became a reality.

However, we have to go back to the physicists (and the chemists), their worries and their reasoning. An arrangement of the chemical elements according to

their chemical properties, made originally by Dimitri Mendeleeff in Russia, provided room for 92 different elements. More than 92 either were not possible for unknown reasons, or else this happened to be the number of elements which existed on earth. At one end of this list, which still showed quite a number of gaps that had to be filled in, there was the gas, hydrogen, as number 1. At the other end of the list there was a metal of virtually no commercial usefulness called uranium. That was number 92.

Atomic Numbers and Weight

These numbers are the so-called atomic numbers. The modern explanation of the atomic number is that this is the number of unit electrical charges which the core or nucleus of this particular element will carry. The nucleus of a hydrogen atom will carry a unit charge of 1, that of a helium atom will carry 2, the nucleus of an iron atom will carry 26 and that of an uranium atom 92.

In addition to the atomic number, every atom has an "atomic weight." This atomic weight (or mass) is the same as the atomic number only in the case of hydrogen. Element number 2, the gas helium, has a weight of four "atomic weight units," element number 26 (iron) has a weight of 56 units and number 92, uranium, even of 238 units. Or rather, it would have been nice if these weights had been such nice round figures. Actually they were not. It became established custom to use the mass of the oxygen atom, namely 16, as a standard and to consider the unit weight to be $1/16$ th of that of oxygen. But then hydrogen came out to have a mass of 1.008, the element boron (atomic number 5) had a mass of 10.82, iron had a mass of 55.58 and uranium of 238.07.

When such atomic weights were first determined, it struck several people that the figures were very nearly multiples of the mass of hydrogen. Was it possible that hydrogen was the only true element and that all others were just clusters of hydrogen atoms? It was an interesting idea, only marred by the fact that the figures could not be made to balance properly. If you considered 55 hydrogen atoms clustered together to form an iron atom, its mass should be 55.44, instead of the slightly higher value found by the experimenters. Of course one could always blame the discrepancy on experimental errors but as time went on and the experiments were repeated over and over again this excuse grew weaker and weaker. Besides if the iron atom consisted of 55 hydrogen atoms its atomic number should be 55.

But everything known pointed to it that the number had to be 26. In short, the idea did not work.

Later other work—largely devoted to answering the question: "just what is electricity"—led to postulating an "atom" of electricity, the smallest electrical charge possible. This particle was called *electron* and it became clear that the atomic number of an element was the same as the number of the electrons per atom. If so, how did an atom look?

Make-up of the Atom

Niels Bohr in Denmark then published his ideas which fit together all the known facts and set the foundation for everything else that was to follow. Every atom obviously had a nucleus around which the electrons revolved like planets around the sun. The nucleus had all the mass and in the case of the hydrogen atom it consisted of just one particle. This particle was called the *proton*. It carried one *positive* unit charge. Around the proton there moved one electron, carrying one *negative* unit charge and having a negligible mass. Now element number 2, helium, had two electrons moving around the nucleus. Since its mass was four units, its nucleus had to consist of four protons. Four protons, however, means four positive charges. Two of them were neutralized by the two electrons going around the nucleus. What happened to the other two? Bohr suggested that there were two more electrons in the nucleus itself to take care of the charges of two of the protons. This reasoning accomplished one thing which had been puzzling, namely why atomic number and atomic weight did not agree.

But it went farther. It could also explain why the atomic weights were very often not multiples of the proton weight. Let's look at element No. 17, the gas chlorine. Its atomic weight was very nearly $35\frac{1}{2}$ units, the small deviation from this figure could still be explained as an experimental error. How could one get an atom with a weight in which half a unit figured? Well, one could get such a weight as an average if one assumed that there were two kinds of chlorine atoms. One kind had a nucleus consisting of 36 protons and 19 electrons which left 17 positive charges which were neutralized by 17 electrons moving around the nucleus. The other kind of chlorine atom had a nucleus consisting of 35 protons and 18 electrons, also leaving 17 charges and 17 electrons on the outside. If these two kinds of chlorine atoms existed in about equal numbers the average weight of the chlorine atom would appear to be $35\frac{1}{2}$.

A chemist would never be able to tell

these two kinds apart because both nuclei are surrounded by 17 electrons and chemical reactions depend on the number and the arrangement of the electrons outside the nucleus. But a physicist could tell them apart because one would weigh 36 units and the other 35 units. For such (then still hypothetical) chemically alike but physically different atoms a new name was needed. It became *isotope*,—meaning "in the same place" (in the chemical table of the elements).

Later it was found that the two isotopes of chlorine weigh 35 and 37 units and that the heavier one is rarer than the lighter one. Together they account for the measured value of 35.457.

Alpha, Beta, Gamma

While Niels Bohr's reasoning pointed out what one might look for, Lord Ernest Rutherford started looking, using naturally radioactive material (radium) imbedded in a deep hole in a block of lead. He found, that three different kinds of rays shot out of the hole and he labelled them *alpha*, *beta* and *gamma* rays. These three rays bore a strong resemblance to what came out of a gun barrel when it was fired. There was a heavy something, his alpha particle, corresponding to the projectile. Then there was something much lighter, the beta radiation, corresponding to the smoke and something immaterial, the gamma rays, corresponding to the flash. We now know that there was a duplication of names. The alpha particle was really the nucleus of a helium atom, the beta "rays" were just electrons while the gamma rays were really rays of the same general type as the X-rays which Professor Konrad Roentgen had discovered decades earlier.

Even the nicest theoretical reasoning is less impressive than a successful experiment—this goes for both scientists and laymen—and Lord Rutherford could show one. Throwing alpha particles at nitrogen atoms he could produce a transformation, the result was oxygen and hydrogen. That was just after the first World War. Experimental proof was now established that atoms had building blocks in turn and that re-arrangements of these building blocks did not only take place in the very heaviest atoms but could be caused in much lighter atoms. With sufficient refinement (or with different experiments) one should be able to observe an energy release. A number of years earlier, in 1905, there had been correspondence between an unknown young physicist, Albert Einstein, and the French mathematician, Jules Henri Poincaré. The idea that mass and energy might be the same thing was

in the air for a very few progressive thinkers and Poincaré suggested to Einstein that the speed of light should be accepted as the "limiting value." Einstein did accept it and a year later his famous formula

$$E = mc^2$$

emerged, E being the energy, m being the mass and c being the velocity of light.

During the ten years that followed Lord Rutherford's destruction of nitrogen atoms, "nothing much happened" as far as the outside world was concerned. What actually happened during that time interval was that physicists probed the various problems mathematically. Now, in 1958, everybody is slightly startled to learn that a highly technical paper was published in 1929 which proved that "fusion," the combination of lighter atoms to form heavier atoms, should exist in Nature. This was the very first hint of future hydrogen bombs.

The big year was 1932.

In that year, two associates of Lord Rutherford, J. D. Cockcroft and E. T. S. Walton, split another atom, namely that of the light metal, lithium—atomic number 3, atomic weight 7. They made a little target of lithium metal and fired protons, or hydrogen nuclei, into it. Now when a proton of unit mass 1 joined with a lithium atom of mass 7 a new atom of mass 8 was the result. The atomic number of this new atom would have to be 4. Of course there is an element number 4, namely beryllium but the mass of the beryllium atom is 9. For some reason an atom of mass 8 cannot exist, so it broke into two equal parts, producing two alpha particles or helium nuclei, atomic number 2, atomic weight 4. Each, that is. The purpose of the experiment had been to check on Einstein's equation. It also accomplished the transformation of lithium and hydrogen into helium.

Enter the Neutron

During the same year Sir James Chadwick realized that some of the experiments had produced results which could not be explained just with protons and electrons. There had to be, he said, another particle which must have the same mass as the proton but not carry an electrical charge of any kind. Since it was electrically neutral he called it the *neutron*. The neutron at once removed some of the difficulties of Bohr's pioneer concepts. Many physicists had not been able to see how protons and electrons should or could exist side by side inside the nucleus. Well, they didn't. What the experiments indicated was that some of the protons

had absorbed a negative unit charge, i.e. an electron. The proton then carried both, one positive and one negative charge, which means to say no charge at all. And that was the neutron. All the diagrams had to be re-drawn; now the alpha particle consisted of two protons and two neutrons.

During the same year Prof. Harold C. Urey, then of Columbia University, isolated one of those isotopes which had been talked about for almost 20 years as a theoretical necessity. Remember that the strange weight of the chlorine atom had been explained by postulating two chlorine isotopes, weighing 35 and 36 units, respectively. But there was very little hope of being able to separate them. It could not be done chemically, for chemically they were alike. Physically there was this minor weight difference of one unit (—actually two, as was found later—) which looked too small to be useful. Now if there were two isotopes of hydrogen it would be different. The heavier hydrogen (provided it existed) could only have a weight of two units since its nucleus would contain a neutron in addition to a proton. Hence it would be twice as heavy as the light isotope. Being that much heavier it was bound to be a little more sluggish. The first experiment consisted in making a gallon of liquid hydrogen and then permitting it to evaporate very slowly. The lighter hydrogen might evaporate a bit faster, leaving more of the heavier atoms behind. When the gallon of liquid had shrunk to one gram (1/28 of an ounce) the residue was tested, there was a heavy hydrogen isotope. It was named *Deuterium*.

Radioactivity Produced

During the same year J. Frédéric Joliot and his wife Irène Curie (daughter of Pierre and Marie Curie) bombarded an aluminum target with alpha particles. Neutrons bounced out of the aluminum plate so the reaction must have been this: a helium nucleus (weight 4) united with an aluminum nucleus (weight 27) and a neutron was thrown out so the new nucleus weighed 30 units. This was an isotope of phosphorus (normal weight 31). Then they removed the unit which had provided the alpha particles. But the aluminum plate continued to throw out particles. For the first time radioactivity had been produced artificially! Moreover the particles were new too. They were like electrons, but their charge was positive instead of negative. They were *positrons*, predicted a few years earlier by Dirac.

Near the end of 1932 I attended a lecture with a title like "The Transformation of the Atomic Nuclei" at the Engineering

Building in Berlin. The speaker had not yet heard about Dr. Urey's heavy hydrogen and spoke mostly about the experiment by Cockcroft and Walton (and about German work by a Professor Miethe) and he came to this conclusion: the transmutation of one element into another is possible, as has been proved. Whether it would be of practical use remained to be seen, but even with an optimistic view one could not expect transmutations to exceed a very few grams of material. As for energy from the atom some experiments had shown that energy was released as predicted but they had also shown that you had to put in more energy by far than you could get out. Hence atomic energy, though it existed, had to be classed as an "untappable source."

Practical or not, physicists continued their experiments, bombarding targets of various metals with alpha particles or with deuterons, the nuclei of heavy hydrogen. They created tiny amounts of elements not to be found in Nature, known elements but of the wrong atomic weight. All these elements tried to adjust their abnormal balances of charge and weight, which they did by shooting particles out of their unstable nuclei. They were radioactive versions of common and harmless elements and were called radio-isotopes. By 1937 not less than 190 such radio-isotopes had been produced, with half-lives ranging from a few seconds to a few score years. The old problem of influencing the rate of radioactive decay had found a surprising solution. You still could not change the half-life of any radioactive substance but you might be able to make one with the half-life you needed.

How About Uranium?

Professor Enrico Fermi had his own ideas. By firing neutrons into aluminum you could "fatten up" the harmless aluminum nucleus into a radioactive phosphorus nucleus. Now what would happen if you try to fatten the element uranium which is the heaviest extant in Nature. One possibility was that uranium simply would not accept any additional particles since for reasons still to be found nothing heavier was possible. Or else uranium did accept additional particles, then you would get elements beyond uranium, elements with higher atomic numbers than 92, so-called *transuranic elements*. What would happen could not be predicted by theory. There just was no theory. It had to be tried. And Fermi did try.

The result was completely incomprehensible. All of a sudden there were four radioactive elements around, with half-lives of 10 seconds, 40 seconds, 13 minutes

and 90 minutes. Such short half-lives proved that these elements decayed with enormous speed, in the case of the first it took just ten seconds for half of the atoms created to decay into something else. These elements were *most* active, just what one might expect of transuranic elements. One could expect this just because they were not found in Nature. If they had ever existed they were gone by now, they were "extinct elements."

Actually this had been the breakthrough experiment.

But it took five years of working, thinking and calculating to realize what had happened. Several teams of researchers went after the "transuranic elements" of Fermi. One of them was a team at the Kaiser Wilhelm Institute in Berlin, composed of Dr. Otto Hahn, Dr. Fritz Strassmann and Dr. Lise Meitner. The outcome of such an experiment always looked as if there were a dozen or more elements, all radioactive isotopes but all resembling known elements chemically. The German team concentrated on one which they took to be a new isotope of radium. They had to add barium for purposes of chemical separation and things were narrowed down to the point where the radioactive element had to be either barium or radium. Of course they guessed at radium which was far more reasonable. But then one experiment proved that whatever was active was *not* the radium. So it had to be barium, element No. 56 and a hundred units lighter than uranium. In January 1939 Hahn and Strassmann (Dr. Lise Meitner, being Jewish, had left Germany in the meantime and gone to work with Niels Bohr) published the statement that neutron bombardment of uranium caused barium to form.

Fission at Last

Slowly the fantastic truth began to dawn on the researchers. Uranium refused to "fatten" and if force-fed it just broke apart into nearly equal halves. Nothing like that had ever been happening to physicists and they did not even have a word to describe it. They had to borrow a term from the biologist's vocabulary. There are single-celled animals which, when they grow too large, split into two independent individuals. This is called *fission* and the same term was applied to the overfed uranium nucleus.

The researchers suspected then that there might be complications and they were perfectly correct. Now we know what really goes on. There are three uranium isotopes, one weighing 234 units (very rare) another weighing 235 units (rare)

and a third weighing 238 units, the common one. Because uranium-234 is so rare, research concentrated on the other two. They did not behave alike. Uranium-235 could not tolerate an additional neutron and broke apart. Uranium-238 could be fattened, just as Fermi had hoped. By accepting one more neutron its weight increases to 239, still uranium, but far less stable than uranium-238. Then one neutron in its nucleus shoots out an electron. By this process that neutron changes into a proton and now the nucleus has 93 positive charges. This makes its atomic number 93 even though its weight is still 239 units. Number 93 is beyond uranium and a new element not existing in Nature. Since the planet Neptune is beyond the planet Uranus this new element beyond uranium was called *neptunium*. But neptunium is very unstable, it almost at once shoots another electron from its nucleus, another neutron turns into a proton and the number of charges rises to 94. Beyond Neptune there is the planet Pluto, hence this was called *plutonium*.

Element No. 94, plutonium, still weighing 239 units, turned out to be the most interesting of all. It is a metal which looks like lead. It is radioactive as all nuclei weighing more than 209 units are. But it is reasonably stable with a half-life of more than 10,000 years. If force-fed with another neutron it fissions. If left to itself it will, after a while, shoot out an alpha particle and turn into uranium-235, which is fissionable too. It is the atom bomb element.

Einstein Writes to F.D.R.

Scientists did not know this yet in the summer of 1939. What they did know was that uranium-235 will fission when hit by a neutron and that, most important discovery of all, the fission of one such atom will release several free neutrons which will set off other atoms and so forth. This was a chain reaction, very much like cars piling up on a busy highway. But it should take only a very tiny fraction of a second to be completed.

Only after the facts of uranium fission and the probability of a chain reaction had become known in scientific circles, could Professor Einstein write to the President of the United States. His letter, incidentally, was not mailed; it was delivered in person by the economist, Alexander Sachs, who acted as emissary.

"In the course of the last four months," Professor Einstein dictated in his slow and halting English, "it has been made probable through the work of Joliot in France, as well as Enrico Fermi and Leo

Szillard in America, that it may become possible to set up a nuclear chain reaction in a large mass of uranium by which vast amounts of power and large quantities of radium-like elements would be generated. Now it appears this could be achieved in the immediate future.

"This new phenomenon would also lead to the construction of bombs, and it is conceivable, though much less certain—that extremely powerful bombs of a new type may thus be constructed. A single bomb of this type, carried by boat or exploded in a port, might very well destroy the whole port, together with some of the surrounding territory . . ."

What happened as a result of this letter is well known.

First, the Manhattan Project which was the forging, on the largest possible scale, of the engineering tools for making the laboratory discoveries practical. Then the first test bomb in New Mexico. Then two operationally used bombs which "gave away the secret"—for all that physicists all over the world needed was a demonstration that it could be done. And a long series of tests since.

All the things which somebody, at one time or another, declared to be either impossible or at least impractical, have been done and found to be practical. An abbreviated list would read about as follows:

Explosive energy from the atom. Has been accomplished by several methods, by the fission of uranium-235 and plutonium-239 and by the fusion of very light elements (e.g. heavy hydrogen) into helium.

Peaceful energy from the atom. Has been accomplished by fission in both stationary and sea-going powerplants. The working principle is to heat a metal of low melting point in the atomic reactor. This metal heats working water into steam, the steam drives a turbine. Then the working steam is re-condensed into water and returns to the heat exchanger where newly heated molten metal is waiting for it. Atomic energy is especially promising for sea-going vessels, on land it cannot yet compete with water power or coal except in coal-less underdeveloped areas. Research to develop a powerplant based on fusion is underway.

Transmutation of elements. This is the ancient alchemist's dream, the production of one element from other elements. It can be done in an atomic reactor by exposing materials to the radiation. Sometimes the material is exposed just to test its resistance, sometimes to change stable nuclei into radioactive isotopes of other elements for research purposes. These are the so-called *Tracers*. Their use is best explained by an example. It is known that iodine, ingested

with food or drinking water, ends up in the thyroid. But which way does it travel through the body and how long does it take? By making a few iodine atoms radioactive their path can be traced.

Creation of Transuranic Elements. In addition to the two wartime transuranic elements 93-neptunium and 94-plutonium other heavier ones have been created, usually in tiny quantities. They are: 95-amerium, 96-curiu, 97-berkelium, 98-californium, 99-einsteinium, 100-fermium, 101-mendelevium and 102-nobelium.

Dating the Past with the Aid of Atoms

One of the most interesting offshoots of atomic theory (not atomic energy) is a method for dating the past. It has been mentioned that the gradual decay of uranium into lead suggested the possibility of dating ancient rocks which is the reason why we now know that the earth must be around 3,500 million years old or why we can say with confidence that a lump of coal formed about 400 million years ago.

Unfortunately this method could not be used when it came to relatively short time intervals like historic times or immediately pre-historic times. The uranium-lead method—or the thorium-lead method—were as unsuitable as would be the mileage indicator of a car for measuring the length of a trouser leg or the width of a desk. For measuring the lengths of periods too small for the geologist another system had to be found. It was originally developed by Drs. J. R. Arnold and W. F. Libby (then both of the University of Chicago) soon after the end of the second World War and it depends on an isotope of carbon which is called radio-carbon, or carbon-14 or just C-14.

Ordinary non-radioactive carbon has a weight of 12 and carries 6 unit charges. Ordinary non-radioactive nitrogen has a weight of 14 with 7 unit charges. Cosmic rays collide with nitrogen atoms in the atmosphere and transform them into carbon atoms with 6 unit charges and a weight of 14 units. Such an atom is not stable, it slowly decays and it has a half-life of 5,568 years (with an uncertainty of plus or minus 30 years). In short there is a "normal" amount of C-14 in the atmosphere. This doesn't do anything to a piece of basalt, but living things, both plants and animals, absorb some C-14. They are, therefore, radioactive to a certain mild "normal" degree.

So a living tree, let us say, has this degree of radioactivity because of C-14. Then the tree is felled, it ceases to live and ceases to absorb C-14 from the atmosphere.

Research into the Structure of Matter. We now know that the following sub-atomic particles exist: the proton (heavy with positive charge), the neutron (heavy without charge), the anti-proton, also called negatron (heavy with negative charge), the electron (of negligible mass with negative charge), the neutrino (same mass, no charge) and the positron (same mass, positive charge). In addition to these a large number of particles called mesons are known; research is continuing to clear up a picture which is somewhat confusing at the moment.

The amount it took on while it was alive slowly diminishes by changing into non-radioactive atoms. Fifty-five centuries after the tree was felled its radioactivity from C-14 would be just half of what is found in living wood. It does not matter, incidentally, whether the wood has rotted away in the meantime or has been burned; that does not touch the atoms.

By simply checking on the C-14 content it is possible to determine the age of an object which was once alive. You could date a mummy, or an old wooden beam, the leather handles on an old shield or the bone handle of an old sword—but not its blade. There are two limits, at both ends of the time scale. A piece of wood less than a century old will hardly produce a reading differing from that of a piece of wood less than a year old. And after 24,000 years have gone by the C-14 content has become so small that one can only say that it is older than this figure. (A recent refinement claims to have pushed the limit to 30,000 years.)

A practical limitation is given by the fact that the specimen is destroyed in the process of checking for C-14 content so that the method cannot be used for rare specimens.

The first actual datings were carried out on pieces of known age to see how well the historical date and the C-14 date would match. Since then all kinds of things have been dated; for example, charcoal from a sacrificial pit at Stonehenge (age about 1800 B.C.), charcoal from the famous Lascaux cave in France with its pre-historic animal paintings (age about 13,500 B.C.); a deer antler found in a mound in Kentucky (age about 3000 B.C.) and dung of the (now extinct) giant sloth from a cave near Las Vegas, Nevada (age about 8500 B.C.).

The C-14 method has provided us with a time-yardstick that will give good enough dates in many cases where we would be completely helpless without it.

APPLIED PHYSICS AND ENGINEERING

Rockets, Jets and Sonic Barrier

WHILE MANY OF THE things people are in the habit of considering "brand new" merely grew up in the four decades since the end of the first World War, rockets and jets actually are brand new. It is true that the fireworks rocket has existed since about 1200 A.D. and that both Germany and Russia can boast an early rocket pioneer at around the turn of the century. But the real development began twenty years later. The first scientific work on rocket propulsion was written by an American, the physicist Dr. Robert H. Goddard. It bore the title *A Method of Reaching Extreme Altitudes* and was published by the Smithsonian Institution in January 1920. (The title page says 1919, but it was not released in that year.) It was a slim volume of less than 100 pages, most of it mathematical derivations and tables. To condense the contents of such a book into a single sentence is not easy but one may say that Goddard proved that rockets should have a great future if time and effort were devoted to their development. Goddard did not make any suggestions as to what should be built—nobody knew then—but he envisaged the possibility of carrying scientific instruments to the limit of our atmosphere and he did make a calculation of what it would take to shoot to the moon.

Three years later another book on the same general idea was published in Germany by the Transylvanian mathematician Prof. Hermann Oberth. Like Goddard's work it talked about rockets. Like Goddard's work it was a small book. Like Goddard's work, it was full of mathematics, in fact more so. But there all resemblance ended. Oberth insisted on the use of liquid fuels; Goddard had mentioned them just once and talked about solid fuels. Oberth gave detailed calculations of assumed liquid fuel rockets and made many suggestions of how they could be constructed. Of course the high-altitude research rocket was his first goal too, but he paid a great deal of attention to piloted rockets and made the first suggestion of a manned, artificial satellite.

Off Ground in 1926

These two books established the theoretical background. The next step was to see whether it could be made to work. Goddard got his first liquid fuel rocket off the ground in 1926 but did not publish anything about his work until the second Smithsonian report in 1936. In Germany

a society was founded for the purpose of raising money for rocket experimentation and doing the experimenting. The society got its first liquid fuel rocket off the ground in 1931. By that time a similar society had been founded in New York under the name of American Interplanetary Society. This society is now, under the name of American Rocket Society, the largest society of professional rocket engineers in the world. (The British Interplanetary Society runs second, the re-constituted German society third.)

In retrospect it is clear that Dr. Goddard was ahead of everybody else in practical experimentation until about 1934. But then the Germans forged ahead, because in Germany the military had taken an interest in rocket research. The rocket research station of the German Army at Peenemünde on the island of Usedom in the Baltic Sea was the first institution to produce a rocket which exceeded the speed of sound. This was the first V-2 rocket that worked properly—it was the fourth built, No. 2 and No. 3 did not work, No. 1 was never tried—and which travelled a distance of 113 miles. As a result of the German rocket work a high altitude research rocket, capable of rising to altitudes of 100 miles or more with a ton of payload, was available to American scientists beginning in 1946. Since then high-altitude research rockets of many different designs are in steady use.

After the second World War, and especially in America, much attention was paid to solid fuels, mostly because a solid fuel rocket is a finished unit that can be stored like, say, a cartridge. Fuel chemists have produced a number of completely new rocket fuels which are safe and powerful. In spite of these advances in the field of solid fuels liquid fuels still play an important rôle. To begin with they still hold a small edge as far as power per pound of weight is concerned. It is generally conceded, even by the solid fuel experts, that any piloted rocket must be propelled by liquid fuels. And even in the guided missile field the liquid fuels are still very important. A liquid fuel rocket has a much longer burning time than a solid fuel rocket which means that there is much more time for the guidance equipment to work. And with more time to work the guidance can naturally be more accurate.

The best results achieved—as far as distance fired goes—can be claimed by a combination of liquid and solid rockets, namely the Army's Jupiter C which

reached a distance of 3,300 miles in November 1956. The high-altitude record seems to belong to a solid fuel research missile, the X-17. One of these research missiles did not go into the prescribed arc for testing but simply kept climbing. Since this was an unexpected performance, it was not tracked, but calculations indicate that it must have reached 1,000 miles.

Sputnik, the Russian Earth satellite, revolves at a lesser altitude.

While rocket development during the second World War was almost all German and atomic energy development was almost all American, the development of the jet plane was a race between the Germans and the English. To engine experts it had been clear since about 1930 that the development of a jet engine depended on the successful operation of a gas turbine. The arrangement of the parts of a jet engine is always about the same. Right behind the air intake hole you have a rotary air compressor which compresses the air sucked in. Then you have a, or usually several, combustion chambers where the fuel is sprayed into the air and burned; then you have the turbine wheel which is turned by the combustion gases (and which powers the air compressor) and then you have the exhaust nozzle. The man who invented the first successful British jet engine, Air Commodore Whittle, took out his first patent in 1930. His engine ran for the first time in April 1937 and the first flights of British jet aircraft were made in May 1941. The first flight of an American jet (with American-built jet engines of the British pattern) took place on October 1, 1942. (By sheer accident this was just two days before the first successful German V-2 shot of their No. 4.) The dates for comparable accomplishments with jet engines and jet planes in Germany are roughly the same as the British dates. One side tested its first engine a few months earlier than the other but then lagged behind by a month or two on the first flight.

But the jet planes of both sides (and a rocket propelled interceptor, the Messerschmitt 163B which the Germans threw into the fray) were all subsonic. No designer yet dared to have his aircraft come too close to the speed of sound. It was expected that something would happen at the speed of sound, but nobody could be certain what it would be.

Strangely enough, theory, expectations and experience did not go together at all. Theory was not too certain what could be predicted. But all artillery shells, and later on all V-2 rockets, moved faster than sound which was a strong indication that it could be done. On the other hand airplanes which in power dives had come

close to the speed of sound suffered severely from what was then called "compressibility effects." The attempt of making a supersonic airplane was postponed until after the war. The first supersonic airplane was the liquid rocket propelled Bell X-1 and it made its first supersonic flight on October 14, 1947. Nothing drastic happened, the pilot (Charles E. Yeager) could tell that he was moving faster than sound by looking at his instruments.

The Sound Barrier

Because so much nonsense has been written about "breaking the sound barrier" it might be advisable to devote a little space to supersonic flight.

Supersonic flight means, of course, to fly faster than sound travels through air. The speed of sound in air depends on one thing and one thing only: the temperature of the air. In normal warm air it is 760 miles per hour. At a greater height, say 45,000 feet for the sake of naming a figure, the speed of sound is 660 miles per hour, *not* because the air is thinner, but because it is colder up there. It follows that a plane which is subsonic 1,000 feet up is supersonic when 40,000 feet up, even though it flies with the same speed. Because the speed of sound changes with temperature—and seemingly with altitude but merely because the air is invariably colder high up—one would always have to specify two things: the speed of the airplane and the speed of sound at the altitude it happens to be. To simplify this the concept of the Mach number has been introduced, the name is given in honor of the Austrian physicist E. Mach who was the first to study such problems. If the airplane speed and the speed of sound at the altitude where the plane flies are equal you say it flies with Mach 1, or $M = 1$. If the plane flies at half the speed of sound it flies with $M = 0.5$, if it flies twice as fast as sound it flies with $M = 2$.

The research plane X-2 did fly with $M = 2$. It can be done, it has been done. Now how did this talk about planes being badly shaken even below $M = 1$ (at about $M = 0.75$) come about? Well, when a plane flies, the airstream moves at different speed over different areas of the airplane. Near the speed of sound the airflow over the wings may already be supersonic but still subsonic around the fuselage. A control surface, when it is moved, may have subsonic flow around one side and supersonic around the other side. It is the speed range of confused flow patterns of the air, called transonic range. So far we do not know how to fly in the transonic range but we do know that things are quiet

again once the airflow is supersonic around every portion of the plane. The current answer to the problem is simply to keep accelerating until safely supersonic.

It seems to be one of the established wrong beliefs that the sonic boom can be heard when a jet plane becomes supersonic. It sounds so "logical," if you crash through a barrier you are bound to make noise. Actually there is no real barrier and the noise is created even when the plane is still below $M = 1$.

To understand this let us first consider an ordinary airplane flying at, say, 200 miles per hour. Since the noise it makes travels at 760 miles per hour the noise runs ahead of the plane. You hear it coming, first faintly, then louder, then it roars overhead and then the noise peters out. Now we'll look at a jet flying with very nearly the speed of sound. To begin with the jet is somewhat noisier, but we can leave this fact out. Whatever noise this jet plane will make cannot run ahead of the plane for the plane moves just about as fast as the noise it produces. If you

watch it and see it coming you will hear absolutely nothing, the noise cannot outrun its source. You, the observer, are still in what Prof. Theodore von Kármán has dubbed the "no signal area." But now the jet is very nearly overhead and the sound it makes moves with it almost like a wall. There is no gradual build-up, suddenly the sound hits you and it then has all the subtlety of a cannon shot.

If the plane flies faster than sound, the noise it produces cannot even keep up with it, for sound can travel only with the speed of sound. The result is that all the noise trails behind the plane like a comet's tail. The noise is confined in a conical space (called the Mach cone), with the plane at its apex. Again you could not hear a thing if such a plane passed overhead; it might be almost out of sight when the Mach cone finally swept over the observer on the ground. He would then be hit by well-concentrated noise, and would probably tell his wife that he had just heard an airplane "crash through the sound barrier."

RADAR

RADAR is one of the three major technological developments of World War II, the other two being the atomic bomb and large liquid fuel rockets. Though it is true that the public did not learn anything about radar until rather late during the second World War it is somewhat older and, as the story of a breakthrough, it resembles atomic energy to a certain extent.

Radar works with very short radio waves and these radio waves constitute a breakthrough themselves, although prior to the period under consideration. It was in 1873 that the Scottish physicist, James Clerk Maxwell, published his *Treatise on Electricity and Magnetism* in which he pointed out that there should be electromagnetic waves which should show the same behavior as light. About a dozen years later, Heinrich Hertz produced such electric waves—for a number of years they were actually called Hertzian waves—and measured wavelength and velocity. He also showed experimentally that they could be reflected by suitable "mirrors" like light waves. It was this work of Hertz which is the foundation of radio in all its forms, including television and radar.

Marconi's Prophecy

A large number of scientists and experimenters went to work on the practical application of these waves, the most successful of them being the Italian Marchese

(marquis), Guglielmo Marconi, who communicated by such waves across the English Channel in 1898. It is a matter of historical record that Marconi prophesied radar. During a lecture delivered about 1906 he spoke of the fact that radio waves are reflected by solid objects and that at some future date this fact might be utilized "to detect obstacles at sea, either in bad weather or at night." At about the same time a German engineer applied for and obtained patents in several countries for just such a device. We now know that it would not work, or only very poorly, if it were actually built. Marconi may have said what he said in defense of the principle.

Marconi returned to this theme in 1922, strongly urging development of such a device. By a coincidence, two American scientists, Drs. A. Hoyt Taylor and Leo C. Young, obtained an accidental practical demonstration during the same year. Sending radio signals across the Potomac River, they noticed what is called a "phase shift" (distortion) of the received signals because a small wooden steamer got in the way. They suggested to the Navy that this be utilized at sea, if a line of destroyers sent such signals to each other they would be "immediately aware of the passage of an enemy vessel between any two destroyers of the line, irrespective of fog, darkness, or smoke screen." During the summer of 1930 it was found—also accidentally—that

an airplane was large enough to reflect radio waves. (Reading this statement now will cause a smile to anybody who knows that near the end of the second World War, American radars succeeded in picking up German three-pound mortar shells in flight.)

Early Airplane Detection Methods

The Director of the Naval Research Laboratory at once informed the Navy Department that an airplane did reflect radio waves and the laboratory was ordered to go ahead. The method involved was to have two stations, one sending and one receiving. When the plane was overheard somewhere between these two stations the receiving station received a signal twice, once directly and once as reflected by the plane.

The radar story differs from the story of atomic energy in that the fundamental fact was known. Nor was it a question of finding the proper explanation for observed natural phenomena. It was mostly the problem of coping with a major difficulty provided by Nature herself, namely the enormous speed with which radio waves travel. It is the same as the speed of light, 186,000 miles a second. If the reflecting obstacle were 1,000 yards away, a "single wave" would need just about three millionths of a second to get there—since its speed is 328 yards in one millionth of a second—and another three millionths of a second to return. If you wanted to find the distance to an obstacle in that manner, you had to measure time intervals of a few millionths of a second and measure them accurately. Small wonder that the early researchers were satisfied with establishing the presence of an obstacle.

The method of detecting aircraft by radio waves worked out by the Naval Research Laboratory was made known to the Army in 1930 and two years later it was officially suggested that it might be better suited for Army use, since it needed two rather large stations which were more likely on land than on shipboard. But the Army looked in several directions at once and the Army's man in charge, Colonel (ret.) William R. Blair, was not at all satisfied with the airplane detecting device, a sound detector, then in use. He decided that better detection methods should be possible. One possibility was to utilize the fact that any engine is hot when running (heat or infra-red detection). Another one was by radio waves. It is now known that Colonel Blair must have made an important invention in the field of radar at that time, for he was granted a patent in 1957 which had been delayed for security reasons. The Army, beginning in

1930, did get echoes from targets such as ships and planes. But the echoes were weak and the targets had to be near. The very short radio waves which could be generated then just were not powerful enough to work well. As a matter of fact for several years the infra-red detectors gave much better results.

The breakthroughs consisted in both the development of a device for generating more powerful micro-waves (the so-called cavity magnetron) and in changing the approach. A normal radio transmitter, with a directed beam, may be compared to a fire hose, it squirts a continuous stream. This continuous stream has a strong tendency to drown out echoes, or at least to make their reception quite difficult. Needed was a device that could be compared to a machine gun, not a continuous stream but a succession of what has been named "pulses" with pauses in between. Such a device was already in use as a scientific research tool; Drs. Gregory Breit and Merle A. Tuve of the Carnegie Institute had been using "pulse ranging" since 1925 to measure the height of radio wave reflecting layers in the upper atmosphere.

The idea of using "pulse ranging" for aircraft and ship detection must have occurred to physicists virtually at the same time. After the war it became known that England, France, Germany and the United States began working out this particular method in the early thirties. Japan, incidentally, started work at the same time, but seems to have discontinued it later. The systems finally used differed from each other mainly in the wavelength used, the Germans (and at an early date the British) used 10 centimeter waves, the Americans 3 centimeter waves. America started in 1933.

The Pulse System

The pulse system consists in sending out a "burst" of waves for a very short time, say one millionth of a second. Then the transmitter waits for "a little while"—three or four thousandths of a second—and then comes the next burst. Since the interval between pulses is several thousand times as long as the duration of the pulse, the returning echo will hardly be received at the instant another pulse is sent out. Hence there is no interference with the detection. What is more important from the practical point of view was that pulse emission permitted putting transmitter and receiver on the same ship (and later on the same airplane). Moreover transmitter and receiver could even share the same antenna which, in time, evolved into the wellknown radar "dish."

Though the radar—the name, incidentally

tally, is a coined word, from radio detection and ranging—worked well there was always the same natural problem. It was a little bit like carrying on a conversation in a moving railroad car, over wheel clatter, locomotive whistles and the talk of other passengers. There was always natural, random radio noise and if you magnified the echo you magnified the random noises, too. Radio engineers thought this had to be accepted and radar operators did the best they could under the given conditions.

Radio Astronomy

Sciences always spill over into each other. Of course not every discovery made in one field will influence all other fields but it is sure that at least one in ten discoveries made in a specific field will not only influence another field of science but even acquire an outstanding value in that field. In the period under survey both atomic energy and the technology of modern electronics have had an influence on the apparently remote science of astronomy, one explaining an old puzzle, the other creating an entirely new branch of astronomy.

The old puzzle was simply where our sun gets the energy which it lavishly radiates into space, second after second, for days, years, centuries and millennia.

The question of where the sun gets its energy came up at a surprisingly late date, less than a century ago. And almost as soon as it came up a satisfactory answer was given, at least one that was satisfactory for a few decades. The man who provided this first answer was the physicist, Hermann von Helmholtz. It is generally conceded, he said, that our sun, as well as all the other stars we can see, began as very faint accumulations of tiny dust particles and of single gas molecules which gradually condensed under their mutual gravitational attraction. It was this condensation which generated the necessary energy. The sun should still slowly contract. The very process of contraction must produce heat. Since the amount of heat released by the sun could be measured, Helmholtz could calculate how much contraction was needed to account for it. The result of the calculation was that the sun should shrink by 300 feet every year, or one mile in 17 years. The diameter of the sun is, in round figures, 864,000 miles so that it would take special observations over quite a number of years to measure such a shrinkage.

The theory had to be accepted just because there was no other and it looked nice until some people started calculating back-

A new breakthrough in the radar field, announced in August 1957, shows that this probably does not just have to be accepted. The new device, called *ordir* (from omni-range digital radar), was developed by Columbia University physicists. *Ordir* is not yet ready for production and all detail is classified information. However, it seems that the *ordir* signal is so different from natural random radio noises that it can always be told apart. Hence, if magnified, it should emerge with full clarity.

ward and forward. The backward calculation aimed to find out when the sun had started shining. The answer was 18 million years. The forward calculation was made to see for how long the sun could go on at the present rate. Well, in another 5 million years it should have shrunk to half its present diameter and should have grown so dense that not much useful contraction could be hoped for anymore. Of course it would still go on for a while but eight million years from now the sun should have become a dark star. And the earth a dead planet.

Geologists were already quite sure that the earth was older than 18 million years and Lord Kelvin decided that the sun was probably stoked by the impact of meteoric matter falling into it. Now this could be calculated too, the aim of the calculation being to find out how much meteoric matter was needed to keep the sun going. By sheer coincidence it turned out to be one earth mass a century. At that point, the observing astronomers dissented. True, they could not measure a shrinkage of 300 feet a year, but if the sun needed that much meteoric matter they should be able to see it. They didn't, hence there was something wrong. Of course it might be a mixture of contraction and meteoric impacts. Or it was something else.

This was before Einstein wrote his equation which said you should get energy by destroying matter.

"Fusion" Paper in 1929

Some twenty years after the equation was written, physicists began to reason that at such high temperatures as prevailed inside the sun the atoms should all be "stripped," i.e., they should be without their electrons. Just bare nuclei, and bare nuclei are more likely to have "atomic" reactions. In 1929 the first paper on "fusion" was published—the basis of the hydrogen bomb—which suggested that at

the proper enormous temperature hydrogen nuclei might unite and form helium nuclei. There is a tiny difference in weight: the four hydrogen nuclei are slightly heavier than a helium nucleus. A small amount of matter, therefore, "disappears," and this vanished matter *must* reappear in the form of energy. The same, incidentally, happens when a uranium atom fissions; the fragments that result weigh a little less than the uranium atom before it blew up. This also means that some matter has "disappeared," and a release of energy must be the result.

I have carefully avoided the term "destruction of matter" because it is apt to cause a wrong mental image. "Destruction," as the word implies, makes one think of the demolishing of a structure, whether it is a house that is torn down or a piece of furniture that is demolished. Here, only the structure has been destroyed, not the matter composing it; the panels and chips of the chopped up desk still weigh the same. In the "old" physics of the last century, it was an axiom that matter could not be destroyed and also that energy could not vanish. The sum total of all matter in the universe remained the same, so did the sum total of all the energy in the universe. In 20th-century physics, the axiom has been changed: the sum total of matter and of energy remains constant, but you can destroy matter (and get its equivalent in energy), and you also can condense energy and get matter.

In the sun, to return to the theme, hydrogen had to fuse into helium, thereby destroying a little matter and releasing a lot of energy. But it could not be just two heavy-hydrogen nuclei getting together to make a helium nucleus. That would release energy all right, but far more than the sun did produce.

There had to be another process. Prof. Hans Bethe in this country and Prof. Karl von Weizsäcker in Germany thought of it at about the same time, without being in touch with each other. It was a six stage process which was not too hard to understand once it is explained. It involves a number of different atoms, hydrogen (H), oxygen (O), nitrogen (N), carbon (C) and finally helium (He). Please note that the little number which precedes, as a subscript, the letter standing for the element designates the element's atomic number (or charge) while the one which follows it as a superscript designates the atomic weight.

The process begins with step

or, in words, one carbon nucleus of weight 12 and one hydrogen nucleus unite to form a nitrogen nucleus of weight 13, accompanied by a burst of gamma rays which are, of course, energy.

Since nitrogen-13 is not stable it throws one particle out of its nucleus, namely a positron (e^+) which converts one of the positive protons into a neutral neutron. This does not change its weight but makes it slide down one number in the atomic scale. Hence step

Some time later another proton, that is a stripped hydrogen nucleus, collides with this nucleus. It is a repetition of step (A) except that the nucleus is somewhat heavier to begin with. Here is step

This nitrogen-14 atom waits around until another hydrogen nucleus comes along and then we get step

Like the nitrogen-13 nucleus the oxygen-15 nucleus is unstable and repeats the performance of the nitrogen-13 nucleus, it throws out a positron, changing into a nitrogen nucleus of the same weight. Like this:

Now we have a nitrogen-15 nucleus which unites with one more proton for step

This last step produces the helium nucleus which might be called "fusion ash," but it also produces a carbon-12 nucleus which was the basic ingredient of step (A). In other words it can now start all over again. And does.

The sun keeps going by producing helium from hydrogen. The reaction just explained—it has the poetic name of solar phoenix reaction—is only one of the reactions that do take place in the sun. Soon after publication of the solar phoenix reaction, C. Critchfield proposed another process which also fuses hydrogen into helium. It consists of five successive stages, involving only hydrogen and helium nuclei. Which of the two processes, the solar phoenix reaction or Critchfield's equations which are called the H-H process, has the lion's share of solar energy production is still uncertain. As a rule the H-H men claim that their process accounts for 90 per cent of the energy release, while the solar phoenix men maintain that theirs accounts for 80 per cent.

Both are agreed that the formation of helium is the poorly kept secret of the sun's energy production.

This was the answer to the old astronomical riddle.

Now for the new astronomical science: radio astronomy.

Radio Waves from the Stars

As has been related, Hertz produced radio waves for the first time in about 1896, they were the longest then known waves. One year earlier, Prof. Wilhelm Konrad Roentgen had discovered the X-rays, then the shortest known waves. In 1898 a third German, a professor of mathematics, Kurd Lasswitz, took it for granted that our sun, like all other stars, also produces radio waves and X-rays. He happened to be right but it took a long time until proof was established; first the necessary test equipment had to be produced. In 1940 there was such test equipment and G. Reber decided to look for radio waves from the sun. His equipment would have discovered a wavelength of 187 centimeters, provided the sun radiated at that wavelength. Apparently it did not, for Reber did not get any results. In 1942 he repeated his tests. He could not be sure whether he received anything or not and he himself reported "tests inconclusive."

But during the same year something happened in Europe.

The Americans, at that time, used radar sets of a type code-named GL for the detection of Luftwaffe planes. The GL radars operated on what we would now consider rather long waves, namely from 400 to 600 centimeters. All of a sudden, in February 1942, they did not operate; they received extremely strong radiation on a wavelength to which they were susceptible. The very first thing that was done was the eternal reaction of the unknowledgeable military bureaucrat, the interference was classified. It could be nothing but German "jamming" of a new type. But when S. J. Hey went over the classified reports, trying to establish where this "jamming," which had extended over several hundred miles, had originated he found that all the "jammed" sets had pointed in the direction of the sun.

This is how radio astronomy got its start. Of course the astronomers had to wait until the war was over before they set up their detecting devices (called "radio telescopes"). Unlike the astronomer who works with visible light, even if photographically, the radio astronomer is not confined to the hours of darkness, he can receive his cosmic radio waves at any time during day and night. It was found that

our sun radiates in quite a number of different wavelengths, for example at 2.5 centimeters, 63.5 centimeters, 152 centimeters and so forth. Some of these wavelengths seem to originate from the surface of the sun, some from its outer fringes, the so-called corona. That radio waves were received from the planet Venus did not surprise astronomers too much for Venus is nearer the sun than the earth, therefore quite warm and radio waves are one of the products of electrical phenomena. It was a considerably greater surprise that radio waves were received from the planet Jupiter. Jupiter had been thought too cold for electrical activity in its atmosphere since it is 483 million miles from the sun—our earth is 93 million miles from the sun. But the real field of the radio astronomer is not our own solar system, not even our own sun which happens to be a rather weak "radio star." Their field is the realm of the distant stars.

The shortest wavelength used at the present moment is 0.8 centimeters, the longest 1,700 centimeters (or about 56 feet since 30.5 centimeters equal one foot). In the future they may go to still shorter wavelengths, but they cannot go to longer ones because longer waves than 1,700 centimeters are stopped by reflecting layers in the upper atmosphere and could be detected only by equipment in a satellite orbit.

For a preliminary sorting, the "radio stars" established so far may be put into three categories. The first category is that of radio stars which are also visible in the telescope. The second category is that of radio stars which are visible as nebulous spots and the third one is that of radio stars which cannot be seen. The last type might be "proto-stars," that is stars still too attenuated to send out visible light. It must be remarked here that old Professor Helmholtz was partially right with his idea: a star does contract out of widely dispersed matter and it first shines with energy derived from this contraction. Only when its center gets hot enough does atomic fusion take over.

The Red Shift

One of the results of this new science of radio astronomy is that the so-called red shift also takes place with radio waves. The term red shift was, naturally, first used for visible light. Red light has a longer wavelength than blue light and in analyzing the light from very distant objects a decided shift to the red end was always found. This shift was the more pronounced the farther the object. Now

there are two possible explanations for this. The first is that the red shift indicates that the distant object is moving away from us. This explanation has led to the concept of the expanding universe. A competing explanation is that the light "tires" when travelling enormous distances. Whatever it is, we now know that it happens to radio waves too.

There is one other area where modern electronics technology is going to spill over into astronomy. This is a television-type device which has been given the name of image intensifier. It is not yet finished and when it is, it won't be any help as far as distant stars are concerned, but it will help with the neighboring planets. The simple fact is that the planets are not at all photogenic. The planet Saturn, for example, will make a beautiful picture to the eye when seen through a good telescope on a clear night. But the photograph taken at the same time is likely to be a mess from the photographer's point of view, just enough to tell that it is Saturn

that was photographed. The reasons why the planets photograph so poorly are summed up by astronomers with the term "poor seeing." What makes the seeing poor is our own atmosphere, which is never completely quiet. For ideal "seeing," the air should be absolutely still along the line of sight. But it isn't. Warm air moves up, colder air sinks down, there are winds. The result is a wavering image, and the wonder is that moments of perfect seeing happen at all. But they do happen, and the observer's eye gets a clear picture. The photographic plate does not, for the light coming from the planet is too weak to produce a good picture in the short time that the atmosphere is good enough to hold still. However, if this instant could be caught on a picture tube, it could be "held" and could be electronically intensified. Once this device is perfected, the photograph obtained will be one of the screen rather than of the planet directly. But it will be a good and clear picture.

CYBERNETICS, AUTOMATION AND SOLID STATE PHYSICS

DURING THE LAST FIVE YEARS or so, you could read an article about automation almost any day of the week. You could also listen to a lecture on automation almost any day of the week, including a sermon in church on Sunday. All the lectures dealt with economic aspects, management problems, union problems and, if a sermon, with spiritual aspects. Why not with the scientific breakthrough, the discovery which made automation possible? Because automation, unlike, say chromatography or synthetic polymers, was not and is not a single scientific or technological event but is a trend instead.

Two and a half centuries ago the early steam engines pumped water from mines. They had valves which had to be turned by hand when the main beam of the engine reached a certain position. The story goes that a boy named Humphrey Potter had the idea of tying a rope from the beam to the valve handle so that the beam closed the valve by its own movement at the right moment. Automation started then, in 1713. Even if this story is not true automation started in 1718 when one Henry Beighton invented a valve-turning device called the plug tree. It was just a gradual development from the steam engine which could run itself except for fuelling, which then was taught to shovel its own coal into the fire box

to a large and complicated assembly of devices which manufactured something.

This is not to say that there were no important ideas generated and applied along the way. One of them was a systematic study of mechanisms automatically controlling automatic machinery, or rather of automatic control mechanisms which made machinery automatic because of their activities. The study was begun around 1940; in 1947 it received a special name. From the Greek word *kybernetes* which means "steersman" it was called *cybernetics*. But the men who created cybernetics themselves pointed out that a fine and reliable cybernetic device had been in existence since 1782, the centrifugal governor of a steam engine, invented by James Watt. Steam engines are so rare by now that it might be necessary to describe this "governor." It consists of two steel balls, suspended from steel links and whirling horizontally, driven by the steam engine. If the engine speeds up, the whirling balls whirl higher, thereby throttling the steam valve so that the machine slows down again.

In a modern device of this general classification it may be the temperature of something which is measured. There may not even be direct action if the temperature rises, the figure may go through a

computer first which then says how much action should be taken. But the principle is not changed radically in any way. The modern device is more accurate by far and can exercise a built-in "judgment."

Solid State Physics

Another new term that has cropped up in recent years is "solid state physics," originally instituted as a study of what goes on in solid substances. Again there is a fine old example around: you magnetize a steel bar. Nothing has happened externally, the steel bar still has the same dimensions, it weighs the same, its chemistry is undisturbed. Still, something must have changed, because it now has a property which it did not possess before.

One modern device which has sprung in a fairly straight line from such studies is the transistor (the name is a condensation of transformer plus resistor), a tiny little thing which does the same job as a vacuum tube. But if the vacuum tube is the size of a small egg, the transistor is the size of a pea. It consumes very little power, it does not warm up and apparently nothing can go wrong with it unless it is destroyed mechanically or heated to red heat. It consists of two solid substances, the metal germanium and the non-metallic element silicon.

Both these substances are by no means recent discoveries, so why was the transistor delayed for so long? Because of the fantastic purity of the materials needed. They must first be refined to the point that they contain less than one "foreign" atom to each 10,000 million atoms. Then specific impurities must be added, at the rate of one atom to each 100 million atoms. Then you get the materials which make the transistor possible and the transistor, in turn, makes it possible to

condense a roomful of electronic equipment to the size of a suitcase.

How does one get such high purities? The system resembles chromatography to some extent. Suppose you have an impurity which will dissolve in liquid germanium but has little tendency to go into the germanium metal which solidifies from the melt. You take a rod of metal and very carefully melt its tip only. Then you move the heat downward a bit so that the metal at the tip re-solidifies. It will now be free of the impurity, the impurities still are in the molten zone. By slowly moving the molten zone down the rod you take all the impurities along and they'll in the end be concentrated in the lower end of the rod which is cut off and discarded. This is called "zone refinement"; it may have to be repeated a few times with the same sample to free it of all impurities.

Another advance from these studies which may become very important is the silicon solar battery. It consists of thin wafers, hardly thicker than a razor blade, of originally pure silicon with a minute addition of arsenic. This is the body of the wafer. The outside layers of the wafer consist of originally pure silicon with a minute addition of boron. One wire is attached to the outside of the wafer, another one to the material inside. When sunlight strikes this wafer single electrons are knocked loose from the atoms and, finding the nicely conducting wires, come out in a steady stream. But a steady stream of electrons is an electric current, so this device produces electric current directly from the energy of the sun's rays.

These are the beginnings—the transistor which has already proved its usefulness and the silicon battery which opens new vistas. To tell what else will result from these studies would need a prophet.

CHEMISTRY

Plastics, Rubber and Fibers

THE CHEMICAL REVOLUTION which put so many new substances on the market and into the household is almost exclusively the result of the last forty years. The key word is a chemical term "polymer," based on two Greek words, which mean "many parts." But, of course, the mere translation of a scientific term never reveals its full and complete meaning; we'll have to follow, in outline, the way the chemists themselves caught on.

Originally chemists made a very strict distinction between "inorganic compounds" and "organic compounds." Although we now know that this distinction is meaningless it is still in use for reasons of convenience. Originally it was taken most seriously indeed.

A substance like rust, produced by the oxidation of iron, was classified as "inorganic"—it happened in the open. Ordinary table salt was another such in-

organic substance. So was ochre and saltpeter and so forth. Opposing them there was a long list of substances that did not "happen" but were produced by a living organism, either plant or animal. Hence they were "organic" compounds which could not just "happen." Sugar was such a substance. Many plants made it but it could not be found in nature otherwise and no chemist could put it together in the laboratory. Some natural dyes also were "organic," a prime example being indigo; the plant that produced it was an important crop. But then a chemist, Friedrich Wöhler, made a substance that previously could "only" be produced by animals, namely urea; this laboratory development proved that what distinguished "inorganic" from "organic" substances was mainly complexity.

All chemists were understandably excited and went to work, making things (synthesizing them, to use the technical term) which normally needed plants to make. The first major success was the dye called indigo. In the process of casting around and seeing what could be done, a most important discovery was made. There were things which came to be called catalysts. A chemical reaction which would not take place with only the necessary ingredients present might take place if there was also a catalyst present. (Or, in many cases, a catalyst would enormously speed up what, without it, would be a very slow reaction.) The catalysts themselves did not change and they were humorously compared to the famous shotgun at a certain type of legendary wedding. The gun did not do anything really and remained unchanged, but because of its presence something took place which would not have taken place, or only much later.

A Sticky "Nuisance"

But while working with organic compounds, with or without catalysts, chemists fairly frequently saw things turn out wrong. The reaction was expected to lead to, say, nice clean yellow crystals. Sometimes it did but sometimes, instead of crystals, you obtained a sticky mess which wouldn't dissolve in anything on hand and could be cleaned up only by hard scrubbing, sometimes not even by scrubbing. The chemist then used to shrug his shoulders and because the stuff often felt like fresh sticky resin say that the "compound resinified." Then he threw it away and started over again, hoping that things would not again "resinify."

What took place unbeknownst to the man to whom it happened, was polymerization and in order to explain just what this is we best look at natural rubber.

The rubber tree—*Hevea brasiliensis*, to give it its botanical name—yields a sap which is called latex. It looks somewhat like milk, and about 62 per cent of fresh latex is just water. The bulk of what is not water was analyzed early and found to have the chemical formula C_5H_8 , just five carbon atoms and eight hydrogen carbons sticking together. The formula was no doubt correct but obviously it told only a small part of the story. The dilemma was this: analyzing rubber yielded the simple formula mentioned. But C_5H_8 , when you had it, was most decidedly not rubber. Then what was wrong?

It was guessed early, and proved later, that Mother Nature had used a special trick. A beaker of C_5H_8 was comparable to a box full of paper clips. But rubber consisted of the same paper clips hooked together in long chains. The rubber "molecule" then was a kind of super-molecule, made up of long chains of 500 to 800 units of the simple C_5H_8 molecule. The first thing to be done was to coin a few terms so that there would be no confusion as to which type of molecule one was talking about, the single "paper clip" or the chain. The chains were called "polymers." The single unit was called a "monomer" (Greek *monas* means both "single" or "a unit") or, sometimes, an "isomer" for Greek *isos* means "equal" or "alike." Causing the monomers to hook themselves into polymers was logically called polymerization.

When, in the past, reactions had gone wrong by "resinifying" they probably had just polymerized, without the knowledge, and, in fact, against the will of the experimenter. On the other hand, natural long polymers had been utilized nicely without anybody knowing just what he was doing. In making rayon, for example, the manufacturers had used the long polymers of cellulose (from wood) to make fibers. Though there had been some earlier attempts, systematic investigation of the long polymers was not attacked until the late twenties and has been going on ever since. The way things progressed is almost typical of many developments. Nature made long polymers, let's duplicate them. This, in many cases, did not work out too well. But in the attempt other polymers that do not exist in Nature, were made and entirely new substances that had never formed in any plant, came into being. And those which proved useful were put on the market.

The Two Plastics Groups

Before we look at a specific example it may be useful to mention that all plastics,

no matter what their chemical composition and no matter whether they are lumps, blocks, powders or fibers, can be sorted into two large groups which, unfortunately, have similar names. In both cases the Greek word *thermos* ("heat") is involved. One group bears the name of thermoplastics, the name indicating that they became plastic (soft) when heated. These thermoplastics behave like the old-fashioned sealing wax. Hard at room temperature it can be softened by heating. When it cools off, it becomes hard again. And you can re-heat and soften it as often as you desire.

The other group is that of the thermo-setting plastics. The name means that the substance "sets" (hardens) when heated. The ingredients are mixed and become plastic through heating. Soon after they set and stay set, just as cake-dough which also cannot be made soft again by re-heating. If something made of thermo-setting plastics turns out to have the wrong shape or wrong dimensions it is simply unfortunate and a total loss. All this also applies to a sub-group of plastics, the epoxy resins which set at room temperature when the proper substance (a liquid) and the catalyst (also a liquid) are mixed.

So much for the names and terminology. Now let's look at a few examples. There is a substance called ethylene, the formula is C_2H_4 and the molecule looks like this

The vertical lines between the letters express what is called chemical "bonds." Each of the two carbon (C) atoms holds on to two hydrogen (H) atoms with one bond, but the two carbon atoms hold each other with a double bond (horizontal lines). When ethylene is polymerized one of the two carbon bonds with which the carbon atoms held each other is used to hold on to the next monomer so that you get a chain like this:

This is polyethylene, used for films and known in the household in the forms of electrical insulation, garden hoses and plastic bottles. A substance rather similar to ethylene is vinyl chloride; it differs from ethylene in that one of the hydrogen atoms has been thrown out and a chlorine (Cl)

atom substituted. So the monomer looks like this

and polymerizes into polyvinyl chloride

which shows up at home in the form of LP records.

If you remove the chlorine atom and substitute a carbon and nitrogen compound (CN) you get this monomer:

and the polymer

Chemists call the monomer acrylonitrile and the polymer polyacrylonitrile but the customer calls it orlon.

Remember the example of the chain of paper clips. If you made such a chain you could have it branch off by hooking two clips to one; or else you can hook an extra clip in at intervals and get an intriguing pattern. If you use molecules instead of paper clips you might get intriguing properties.

The molecule I have in mind is called methyl methacrylate. It isn't much more complicated than the others and is represented like this:

Here you have such a dangling paper clip. Put together in a chain you have polymethyl methacrylate which looks like glass, is called lucite or plexiglas (depending on the manufacturer) and appears as display cases, hat holders, pocket combs and "glass" heels on evening slippers.

As a final example: there are paper clips which look silvery and others which look coppery. Why not make a chain which hooks them up alternately, one silver, one

copper, one silver, etc., etc. In stricter terms: form a polymer of two different substances. There is one which has the admittedly difficult name of hexamethylenediamine

The other substance is called adipic acid and represented as

When they are hooked up in long chains, the two monomers alternating, you have nylon.

Most of the modern plastics, then, consist of very large molecules which are formed because smaller molecules are hooked together. The whole field is based

on an understanding of what really took place when a compound has unexpectedly "resinified." Naturally the field is still growing, for our modern plastics, while good, are not yet perfect. The two main wishes of chemists and engineers reflect the two main drawbacks. There is no plastic with a really hard surface; they all get scratched up in use sooner or later. No can they stand heat very well.

The first of these two wishes can probably be granted by the plastics experts: it should be possible, though probably difficult, to produce hard-surfaced plastics. The wish for high heat resistance is a different story; one probably cannot expect a plastic to hold together far beyond the temperature at which it "sets." But here another group of new substances has come in. They are called "cermets" (from *ceramics* and *metals*), which term indicates their composition. They are still new, but within another decade there probably will be as many cermets—at least in industry—as there are now plastics in the household.

Tall Columns and Filter Paper

How do you separate a mixture of iron filings and lead filings? Simple, you use a magnet. What the magnet takes away is iron, and what is left behind is lead. How about a mixture of lead filings and sand? You just heat it, before the mixture even gets to be red hot the lead will have melted and can be poured off while the sand remains behind. Now a mixture of brass filings and sawdust? You dump it in a pail of water, the sawdust will float and the brass will sink. But how about a mixture of brass filings and gold dust? In such a case you would resort to an acid which dissolves the copper and the zinc that form brass but which leaves the gold untouched.

These are all simple examples of separation methods which take advantage of one characteristic or another. In one case, the fact that iron is magnetic is used; in another, advantage is taken of the low melting point of lead, or else the fact that one weighs more than the other is utilized. If you had a mixture of iron filings, sand and sawdust you may have to use a two-step process, first floating off the sawdust and then separating the remainder with the help of a magnet. If nickel filings were mixed in, too, the thing would be more complicated by far, for both iron and nickel are fairly alike in weight and both are attracted by a magnet.

The greater the number of substances, the more difficult the job of separating them and even more difficult if some of the substances in the mixture have similar properties. The most difficult job of that kind which has confronted chemists so far was that of the separation of the so-called rare earth metals which chemists, in moments of despair, have dubbed the "gregarious metals." There are sixteen of them and they have names like lanthanum, cerium, praseodymium, gadolinium, yttrium, ytterbium, thulium and so forth. The layman is likely to swear that he never came across one and never heard any of these names. The latter may be true but the first assertion is not, provided he uses a cigarette lighter. If he does, he carries several of the rare earth metals around with him. The "flint" in his lighter is mostly cerium, with some of the others present as impurities in the cerium. In the case of the lighter "flint" purity of the metal is highly unimportant.

But for other uses, purity is very important. How can you even investigate the properties of a metal if all you ever have is a hopeless mixture of eight or nine metals in unknown proportions? The term "gregarious metals" is only too true; they always occur together and their properties are much alike. Their discoverers had to resort to the most complicated methods of

chemical trickery to separate them. It was always difficult, incredibly tedious and never quite satisfactory.

The "Green Soup"

The solution to the problem came from an entirely unexpected corner. In about 1907, a Russian botanist puzzled over a greenish soup consisting of ground-up plant tissue. His name is transliterated from the Cyrillic alphabet either as Tsvyet or as Zvyet; at any event it was an apt name for a Russian botanist for it is the Russian word for "blossom." Tsvyet seems to have reasoned as follows: if I put this ground-up plant tissue into a tall glass pipe, the various ingredients will sort themselves out according to their specific gravity. The heaviest substances will end up at the bottom, the lightest ones on top. But I am not so much interested in their weight, I am interested in their chemistry. Now if I fill this tall glass pipe with a chemical and let the liquid to be investigated dribble through I should get a chemical separation. Some of the ingredients of the green soup will combine very readily with the (pulverized) chemical in the tube. They'll then be at the upper end; then I should get a layer of ingredients which also combine with this chemical but not as readily. And at the very bottom there will be those that do not combine at all.

Since many chemicals have a color of some kind and the experiment resulted in layers of different colors the method was dubbed *chromatography*, from the Greek word *chroma* for "color" and *grapheo* which means "I write." Incidentally, Tsvyet's name was still apt, for the Russian word "tsvyet" is also the colloquial word for "color." The reason why nothing was heard of this for a long time is that Tsvyet's investigation aimed at something which chemists still can't do (to find out about photosynthesis, which will be explained later). He simply bit off far more than he, or anybody else in his day, could chew.

In 1932, the German biochemist, Willstätter, revived chromatography as a means of chemical investigation and it proved to be a very useful method. A dozen years later chromatography took its next big step, this time in England. It was found that high grade blotting paper will always have a very, very thin film of moisture. You can get rid of this very fine film by drastic means, but its presence rarely does harm and is sometimes very useful. Because of this film of moisture a piece of blotting paper could replace the older glass tube. One could soak the paper

with a chemical and then let the liquid to be investigated creep up in it. The result would be the same, those substances which combined most readily with the chemical would combine first and "get stuck," the ones which combined more slowly would creep up farther and those which did not combine would creep all the way unhindered. The big advantage was that you then had all this literally "on paper" which could easily be cut up for detailed investigation of the various areas.

Paper Chromatography

This method was called "paper chromatography" and the older method was renamed column chromatography. Paper chromatography is one of the most important chemical research methods now; one chemist said that if paper chromatography were banned, whole branches of chemistry would come to a grinding stop.

Before paper chromatography had been thought up, column chromatography was used extensively in atomic energy work, where it was also necessary to separate chemical compounds. And the people involved in it knew that what usually takes place in these columns is that a hydrogen nucleus changes place, hence they spoke of an "ion exchange." Since they knew what they wanted, they discarded the simple chemicals like aluminum oxide and calcium carbonate that had been used in early researches and made themselves synthetic polymers just for this purpose. They were complicated from the layman's point of view and bore equally complicated names (one much used is labelled: sulfonated styrene-divinyl-benzene copolymer) but they could be made in quantities and they did the job. For laboratory work, paper chromatography is usually more convenient, but column chromatography also has a strong point: you can get fairly large amounts of the substance you are chasing.

Since columns filled with such synthetic resins could separate closely related substances and could also produce amounts like half a pint of this and a quart of that, why not make the columns much taller and bigger and use them for production?

Monazite Sand

The production items were the "greivous metals." Drs. Spedding and Powell of the Ames Institute for Atomic Research (now the Ames Laboratory of the Atomic Energy Commission) had shown that ion exchange would separate compounds of the various rare earth metals. The industrial process developed during the years since the war works as follows: The

raw material is something called monazite sand. This contains the rare earth metals, or rather compounds of the metals in what used to be an inextricable mixture. First the whole is dissolved in nitric acid to make it more tractable. Then it is treated with oxalic acid. This removes impurities that are not rare earth metal compounds. After the treatment the rare earth metals are left in a form which the chemist calls oxalates. The oxalates are then changed into oxides, which can be (and are) dissolved in hydrochloric acid.

If a chemist had done all this prior to the making of synthetic ion exchange resins he would still not have accomplished anything; it is still a mixture of all the rare earth elements, only they now are in different chemical compounds. But now the solution goes into the column with

the co-polymer mentioned a few paragraphs back. The different rare earth metals "stick" to the resin, chemically speaking. The point is that some are held more strongly than others. Now comes the separation. It is done by adding another chemical (an ammonium salt of ethylenediamine tetracetic acid) and this replaces the rare earth compounds held by the resin. First the one least strongly held is let go, and it accumulates at the bottom of the column which may be several stories tall. Then follows the one that is a little less strongly held and so on, until the one most strongly held collects at the bottom and is syphoned off.

By this means, we cannot only separate the gregarious metals but we can do so in commercial quantities and with high purity.

The Secret of the Green Leaf

There is one chemical reaction which may be called the most important chemical reaction on earth. Without it there would be no life. But this reaction is still a secret of Nature. We do know what happens but we are still trying to find out how it happens and how to duplicate it if we can.

This reaction is called *photosynthesis*. "Synthesis" means the building up of a chemical compound, the "photo" part of the word is from the Greek word for "light." Hence it means a synthesis caused, or aided, by light. Green plants practice photosynthesis every day. They take water, simple H_2O , from the ground, along with it a few dissolved minerals; they take carbon dioxide, simple CO_2 , from the air and they use the energy supplied by sunlight to convert the simple raw materials into sugars and starches and cellulose and even vitamins, usually having free oxygen left over which they return to the atmosphere for the animals to breathe.

Since there would be no life without photosynthesis—and since photosynthesis presumably could be used to make synthetic food—scientists have been most interested in this process for a long time. Indeed the invention of column chromatography, as has been mentioned, was a

by-product of the search for the secret of photosynthesis. So far the secret is still a secret, but a few things have been learned.

Apparently plants use two different methods of photosynthesis. One, which has been guessed at for quite some time and is for this reason referred to as the standard method, has sugar as its first important intermediate product. While the plants obviously store some of this sugar as sugar, most of it is used up for further conversions, into proteins, fats and vitamins. Another more recently discovered method used by plants is to make a substance called aspartic acid. A number of steps farther up the ladder would be sugar, but at least some plants go on directly from the lower step to amino acids and protein.

So far scientists have not yet succeeded in tracing all the steps and even after they have all been traced this does not constitute an absolute guarantee that they could be duplicated. But it appears likely. If we succeed in using photosynthesis first in the laboratory and then in the factory we'll have made a breakthrough almost as important as the release of atomic energy.

MEDICINE

MEDICINE EMERGED FROM the first World War with a most impressive array of surgical techniques and a large store of knowledge about diseases. Many types of

sickness, it was known, were caused by bacteria and in the course of time a number of ways of fighting such bacteria were found. In some cases one could use im-

munizing injections, in some cases curing injections, both based on the fact that the body of an animal, sick with the same disease, produced something, it was not quite known what, which killed off these bacteria. In a few sicknesses, chemistry had been called upon to help and succeeded in producing highly specialized chemicals, which killed the bacteria without harming the body cells of the patient.

While there was a great deal of knowledge, it was clearly realized that there were a few areas where knowledge was completely lacking. Diabetes was a case in point, an often fatal disease which was decidedly not contagious, hence not caused by an infection in all probability. Something seemed to go wrong in the patient's body and it was suspected that whatever went wrong did so in the pancreas gland. Then there were a number of sicknesses which also were not contagious and which resembled slow poisoning; often the patients recovered after a mere change of diet. And then there existed a large number of diseases which very obviously were caused by infections, with the major mystery attached that it was impossible to find the organism which caused the infection.

To understand the difficulty in which the researchers found themselves, we have to go back to the last decades of the 19th century when there was still a lot of debate as to whether bacteria did cause diseases. Dr. Robert Koch laid down three rules which he wanted to see fulfilled if somebody expected him to endorse a claim that researcher So-and-so had found the cause of Disease X. The first rule was proof that the bacillus had been found in the body of the patient. The second rule was a demonstration that So-and-so had succeeded in isolating the X bacillus and in growing it as a so-called "pure culture" outside the living body. The third was that bacteria from such a culture should infect an animal with the X disease.

These were good and useful rules, but the dreaded hoof and mouth disease of domestic cattle provided the first stumbling block. It was very contagious but its cause could not be found. To strain bacteria from solutions, filters of unglazed porcelain were in use. The porous porcelain permitted a liquid to pass through its tiny holes. The unit of measurement used in such work is the *micron* which is the thousandth part of a millimeter. (There are 25.4 millimeters to the inch.) The holes in the porcelain filters were smaller than that, measuring from 0.2 to 0.8 of a micron; most bacteria are larger than a micron. Since the suspected cause of the cattle disease passed such a filter it was obviously an extremely small bacillus.

But then it turned out that Dr. Koch's second rule could not be fulfilled either; the "filter-passing organism" apparently died off outside the living body very fast. After a while the name "*virus*" was suggested for such filter-passing organisms, but most researchers, even though they adopted the term as a matter of convenience, continued to think that a virus was simply a very small bacillus. They might be small but they were certainly important; by 1925 it was known that at least forty different diseases were virus infections, among them everything labelled cold, flu or grippé, also typhoid fever, Rocky Mountain fever, measles and so on. Such virus organisms not only attacked people but also animals and plants. A well-known plant disease of that type was the "mosaic disease" of the tobacco plant.

The next step had to wait until 1935 when Dr. Wendell M. Stanley could show that the tobacco mosaic virus could be crystallized. This was an unheard-of development for crystals are "dead," while a virus in action had to be considered as "alive." The virus then turned out to be something that could be either, something not near but on the borderline of life and non-living matter.

How a Virus Looks

In the years since Dr. Stanley's discovery a great deal of additional work has been done on the tobacco mosaic virus, especially by the Virus Laboratory of the University of California. A new research tool, itself a development of the last four decades, helped in this work: the electron microscope which can produce magnifications that would have been considered impossible and fantastic half a century ago. With the aid of this instrument it could be established that the tobacco mosaic virus normally has the shape of a rod, 0.3 microns long, and 0.015 microns thick. It is a thickwalled cylinder of protein with a rodlike core of nucleic acid (the term nucleic acid refers to the nuclei of cells, not the nuclei of atoms) which accounts for about 6 per cent of the total weight of the virus.

Now it was possible to break down the virus by chemical treatment; what was finally left appears to have about the shape of a washer cut into four parts. This might be a single molecule. If the chemical treatment has been gentle enough these supposed molecules will rebuild a virus, they join together and, in the arrangement of a spiral staircase make 130 turns which brings the length to 0.3 microns. And fresh ribonucleic acid would re-form a core and this re-built

virus proved to be alive by infecting tobacco leaves.

All this is in the realm of research. But

that much has been learned about fighting virus diseases was dramatically illustrated by Dr. Salk's polio vaccine.

The Isles of Langerhans

The story of diabetes can be told in fewer words, mostly because it is much better known to the public. Late in the last century it was proved that removal of the pancreas immediately produced severe diabetes. Obviously this gland produced something that kept chemical order in the body; if it was absent, disorder set in. It was subsequently found that other glands in the body also produced substances which regulated this or that (for example growth) and these substances received the general name of *hormones*, which means about the same as the word "exciters." To return to the pancreas specifically it is a rather large gland and

imbedded in it are areas which physiologists called the Isles of Langerhans.

There was reason to suspect that it was these isles which produced the regulating substance, the hormone. But it was not proved until 1921 and since the substance, finally found, came from these isles (in Latin *insulae*) its name became insulin. It happens to dissolve in alcohol so that alcohol could be used to extract it from the glands of slaughtered animals and also of large fishes. By 1922 insulin became available to supply bodies of living men who for still unknown reasons fail to manufacture it themselves. Other hormones have followed since.

Vitamins and Wonder Drugs

The story of the vitamins resembles that of insulin in that it began with a clearly felt lack of knowledge. There were these slowly progressive sicknesses like beri-beri, pellagra and the dread of the sailor, scurvy, and the picture was always the same: a kind of slow decay for which no reason could be found. But if such a sick person were removed from his environment he often recovered, again for no discernible reason. It had something to do with what people ate, but what and how? Every once in a while a European doctor working in what were then colonial areas of the Far East drew the conclusion that the native diet might contain a slow and probably mild poison. It did not hurt somebody who ingested it only once or a few times, it probably had to accumulate over a long period. And that, the reasoning could be carried on, was why it was so hard to find.

We now know, of course, that the reasoning went in the wrong direction. The sickness was not caused by what the vitamins ate, it was caused by what they did not eat.

These mysterious sicknesses were what are now called "deficiency diseases," and the deficiency was usually a vitamin deficiency, though vitamins had not yet been discovered.

The story of their discovery is complicated, mostly because researchers in various countries attacked the same problem at about the same time. Moreover, they did not know very clearly just what problem they were attacking, and they do not seem to have read each other's publica-

tions all the time. That the first World War intervened in the early stages of the work did not help matters either. Nobody could have told, at any moment up to the end of the first World War, just where science stood in these matters. Now we know that laboratory rats provided the first clue. Dr. F. G. Hopkins in England and Dr. Stepp in Germany both kept laboratory rats on a really "pure" diet—purified fats, purified proteins and carbohydrates. It was as scientific as possible, but the rats died. However, if they were given milk to drink instead of distilled water, they carried on. This was done during the years 1906 to 1912, and the idea that something must be missing took hold. In 1912, Holst in Norway found that scurvy could be cured by the juice of green cabbage leaves or the juices of citrus fruits (which do not grow in Norway). Holst reasoned that these plant juices contained an unknown substance (now called vitamin C or ascorbic acid) which produced the cure. In retrospect it seems as if this unknown substance was thought of as "medication" rather than as something which remedied a deficiency.

The story then jumped to America, where Dr. Elmer V. McCollum also kept laboratory rats on a strictly supervised diet, just as Drs. Hopkins and Stepp had done. Dr. McCollum's rats were not nourished adequately; they were purposely slightly underfed as far as carbohydrates, fats, etc., went. But Dr. McCollum had extracted something—he didn't know what—from butter and egg yolks by using ether as a solvent. His undernourished rats even grew if he added this "accessory sub-

stance," as he called it provisionally. The next discovery was that two different "accessory substances" were needed. One of them was soluble in fat and was labeled "substance A"; the other dissolved in water and was labeled "substance B." Several years later, a Polish researcher, Casimir Funk, suggested the name vitamin for these "accessory substances," based on the Latin word *vita* for "life," as substances essential to life.

The next surprising discovery was that one did not have to rely on plants. Up to 1923 it had been thought that here was simply another example of the chemical versatility of the plants. Plants not only made sugar and starch and fat, they also could produce colors and odors and vitamins. Animals simply could not do this. However, animals, and men, did. Vitamin D they can make themselves, with the aid of ultra-violet light from the sun. Ultra-violet light had already been used directly to cure rickets but while the cure had worked nobody had any idea that a vitamin formation had been involved. This was established in 1924.

One might say that by that year the vitamins had been "discovered." Much of the remaining work was refinement, as for example discovering that the vitamin called B was actually a complex of a large number of substances. Only one more thing remained to be done. In a reference work printed in 1941 it is still stated that "vitamins are substances of unknown composition." Only a few years later the composition became known. Synthesis followed hard on the heels of successful analysis.

When the term "modern drugs" is used the layman usually remembers recent drug history in about the following terms: "first there came the sulfa drugs but then penicillin and other antibiotics were discovered." Actually penicillin was discovered by Sir Alexander Fleming in 1929, while the discovery that drugs, of a type called sulfanilamide by chemists, destroy bacteria was made in 1932 by Gerhard Domagk. And, of course, both were not brand new. European peasants, for centuries, tied moldy bread to wounds, claiming that this prevented inflammation and pus formation. And compounds like the sulfa drugs had been known, as chemicals, to chemists. There are, as may be remarked in passing, quite often long time intervals between a discovery and its application; about three decades went by between the first making of DDT and its first use.

The Sulfa Drugs

The reason why the sulfa drugs appeared on the scene first was a simple

one: once chemists knew that there was a market for such compounds they could produce them in quantity with little delay. But penicillin, and the other antibiotics which followed them, terramycin, aureomycin and so on, had to be grown. That means evolving a technique for growing the molds; mistakes can be made in evolving the technique and, in general, it takes time.

Chemists specializing in drugs, even those who have personally benefited by injections of antibiotics, tend to feel that the future will belong to the drugs rather than to the antibiotics. As time goes on physicians are bound to encounter more and more strains of bacteria which are not killed by, say, penicillin (or by sulfa drugs for that matter). It isn't that they "got used to it." What happens is that among the millions and millions of bacteria there are a very few that happen not to succumb. All the others die off, these few survive and multiply and produce a new immune strain. Hence new drugs will be needed all the time although it is quite possible that a strain of bacteria which is not harmed by the latest innovations, might be felled within hours by a drug long out of use. Whether the molds will produce new antibiotics is a question, although one can work in that direction too. But the chemists think that they'll be able to produce new bacteria-killing compounds faster than the biologists can grow new antibiotics. Moreover, a carefully tailored drug molecule will not produce unwanted side effects.

The very latest in drugs is an answer to a very recent danger, namely the anti-radiation drugs. Everybody knows of the victims of atomic radiation, but usually stops reasoning at that point. But between acquiring the radiation and succumbing to it there is a chemical interlude. The radiation causes chemical changes in the body and these changes ultimately cause death. If one could stop these changes from taking place everything should be at least reasonably well. One such anti-radiation drug has already been announced under the code name of AET. Researchers found that much of the damage in the body is caused by a kind of "fragments of molecules" which chemists know under the name of "free radicals." AET binds these free radicals and makes them over into harmless substances. The drawback with this particular drug is that it must be taken before the radiation damage occurs, the drug must be present in the body when the free radicals form. However, this is only the first drug of this kind and research work is going on on more. Even on a peaceful earth anti-radiation drugs will be needed.

HOW NOT TO LOSE MONEY

By

SAM SHULSKY

Assistant Financial Editor of
The New York Journal-American
and author of the column
Investors Guide

INVESTING MEANS, simply, putting your money out to work. Investing in common stocks means buying a share of a corporate business. It means, actually, going into business. And business implies risk.

In the first chapter we shall talk about large and small investors, young and old investors—and those who should not be investors. There is nothing in our Constitution which declares we must all invest in business. There is no basis for the oft-repeated, but loosely thought out argument that, “we must all help build American enterprise.” We do that with our work. Many of us have neither the capital nor the temperament to do it also with our savings.

Risk should be undertaken only by those who can assume it, and even then only after they have set up certain safeguards first. These safeguards—for the average person—are insurance and emergency savings. To sally forth in search of investment profits before erecting these defenses would be foolhardy.

SAM SHULSKY

I would like to go beyond Mr. Shulsky's sound advice and make clear that we are not suggesting to our readers to invest in stocks if they have not already made the decision to do so. This section is intended only to help and guide people who are already investors or have decided to become investors, before reading this section.

We selected Mr. Shulsky to prepare a guide for investors because of his excellent reputation as a financial columnist and because of his ability to make the subject interesting, simple and clear, using the effective technique of questions and answers.

DAN GOLENPAUL, *Editor*

Who Should Buy Stocks?

Q. I am 24, married, one child. Earn \$120 a week in an auto plant, have \$200 in savings bonds, bank account of \$250 and \$1,500 life insurance. What stocks should I buy?

A. I don't think you have any stock-buying money, as yet. First you ought to sign up for more life insurance while you are still young and can get it at low rates. Ten times the amount you now have would not be too much for a young family man. Secondly your savings account should equal 3 to 4 months wages, especially since you are in a seasonal industry.

If owning your own home is important to you, that, too, should take precedence over investing in stock.

Q. I am a secretary, 24, earning \$75 a week. Live at home and therefore could save about \$10 a week for investment in stocks if I could establish a regular investing habit. Have \$1,500 in the bank and \$500 in E bonds, no dependents.

A. Two programs suggest themselves as best suited to your needs: a monthly investment program or a mutual fund. See the articles on those plans.

Q. I have two children, 14 and 15. How do I start investing for their college education?

A. You will be needing this money in 2 to 3 years. If the stock market, having risen almost steadily for 9 years, should turn around and go into a decline you may not be able to sell out anywhere near your purchase price.

Dollars which will be needed within a few years should not be put into stocks. It would be much better to put them into a savings bank or a Federally insured savings and loan where you can earn 3 to 4 per cent interest.

Q. I have inherited \$5,000. I have never bought stocks, but own my home, have savings account, \$3,000 in E bonds and ample life insurance. I would like to buy some stock with this extra money. What would you advise? I am 47, married, two children, covered by Social Security.

A. There is no reason why this money could not go into shares. Split it up between good quality shares which pay about 5 per cent and growth stocks which may pay very little but enjoy considerable appreciation potential. Just because you received the money at one time is no reason for investing it all in one day. Space your buying to take advantage of any market fluctuation.

Q. I am a widow, 77, and have just

collected \$25,000 in life insurance. What stocks should I buy? My other assets are a home, free and clear, and \$1,500 in a savings bank. I have no dependents.

A. There are several courses open to you.

1. You could go into common shares, stressing high safety and yielding you anywhere from 4½ to 5 per cent.

2. You could invest in any of several high grade railroad and utility bonds which today yield about as much as stocks.

3. You could buy a single payment annuity which would begin immediately to pay you a fixed sum, for life.

There are certain advantages to all three. The common shares could be expected to increase their dividends should we experience further inflation. In that way you could hope to maintain your living standards even should prices rise. The bonds are, of course, safer investments as far as principal is concerned. And the annuity is a top safety, guaranteed payment for life. You will never be left without some income.

Before you make any choice you should discuss with some of the large life insurance companies just how much per month for life \$25,000 will buy for you. If it works out to better than \$110 a month that would mean more than 5 per cent on your money, which is as much as you can expect from securities with the safety you require.

Perhaps a cautious arrangement would be to split the money between an annuity and common shares. In that way, the stock income can be expected to help you meet inflated prices. If we run into a period of deflation, when dividends from stock may decline, your steady income from the annuity will represent increased purchasing power.

Q. We are a retired couple, 69 and 67. Receive maximum Social Security plus a small private pension. Have \$850 in the bank. Would like to invest it for additional income. What would you advise?

A. If you put that money into a stock with the high safety of A.T.&T.—and you should take no chances—your income would be about \$45 a year. In the bank it should be earning you nearly \$30 a year. The \$15 difference, about 30 cents a week, is hardly worth the disadvantage of doing without ready cash plus the additional fact that in stocks—even in securities of A.T.&T. quality—your \$850 may be worth \$900 one month, but only \$750 the next. The bank is the best place for the money.

How Do I Go About Investing?

(See "What's an Investment Club," page 131.)

All securities are bought through a broker. He may be a stock exchange member who will charge you commissions. He may be an "over-the-counter" broker who sells the stock to you directly from his own shelves in exactly the same way the grocer sells you a pound of coffee, in which case he makes a profit by marking up the price above what it costs him. The way you go about selecting a broker is very important.

The way to pick one is to visit several—large or small. Explain your program to them and listen to the way each one would handle it. Some may tell you quite frankly they are not equipped to handle your business. That's not snobbery, just good business. You wouldn't expect to buy 10 cents worth of nails at the main warehouse of U. S. Steel.

In addition, you must keep your ears open for attitudes. If you are a cautious Joe and want to put your money to work for a 5 per cent return, taking as few chances as possible, don't sign up with a broker whose account executive continually harps on the money he's made for his customers in penny Canadian mining stocks. You won't be happy there.

Conversely, if you are a young fellow with no dependents, a steady, but sober job and a comfortable bank account to fall back on and want to embark on a program of capital appreciation, don't sign up with a broker who devotes most of his time to handling the government bond accounts of elderly widows.

Q. I am 28, and would like to invest \$100 every six months. How do I go about it? Do all brokers charge the same commissions? Since I will have only \$200 a year, should I set up an account with a small firm?

A. The amount of money you have to invest has no bearing on the size of the brokerage firm. In fact, larger firms generally are more eager to get small accounts than the smaller firms since the large brokerage houses are often equipped with all forms of automatic bookkeeping devices which make small accounts profitable.

Q. In the last three days I've received two telegrams and a phone call from some broker in Toronto who—

A. Hang up, quickly! Legitimate brokers do not solicit customers by telephone or telegraph. They advertise and offer analyses and studies to those who mail in coupons, but they do not use "sucker

lists" in the way peddlers of cheap stock do. Anyone who spends \$5 to \$10 soliciting a strange customer for the purpose of selling him as little as 100 shares of 25 cent stock is obviously not selling legitimate securities.

Q. I would like to start buying stocks, but haven't much more than \$20 a month to invest. Some of the men in the office want to start an investment club. Is that a good idea?

A. Investment clubs have enjoyed phenomenal growth in recent years.

Q. We are newlyweds, both working, and have been putting \$10 a week into E bonds and \$15 into the bank. We are shopping for a home. Would it be wise to switch our savings into stocks so we can make some money and have a bigger down payment on a house?

A. No. If you are actively looking at homes, the only place for your funds is in the savings bank—not even in E bonds. You may find a suitable home next week, next month or in a year. If you cash in your E bonds your interest will amount to far less than the bank interest.

If you buy stocks in small amounts now, the commission costs will be about 6 per cent. It will cost you the same to sell when you need the money for a house. That means you would lose 12 per cent on your money and have no way of determining whether you will get back as much as, less or more than you put in.

Q. I run a drug store in a small village in Iowa. My money is tied up in my business and in a farm which I rent out. I would like to start buying stock, but the nearest broker is 75 miles away. What would you advise?

A. You don't have to sit in front of a stock market ticker all day in order to be a successful investor.

However, you should make at least one trip to the city to discuss your plan with some brokers. (You can get a list of those in your area by writing to any one of the dozen and a half stock exchanges in the country.) When you get back home select one. Thereafter, you can do all your business by mail or phone.

It is quite possible the commercial bank in your town will execute orders for you. Often there will be a slight additional charge since the bank must pay the same brokerage commissions a private investor does. However, it may be worth it to you if you value the advice of your banker.

It is also possible that your town has a securities broker who is not a member of any large exchange, but deals "over-the-counter." Here again the individual concerned and your relationship to him may be a determining factor. In either case—bank or over-the-counter dealer—you can

always check the cost of doing business with them against the prices listed in the daily newspapers. Ordinarily, brokerage commissions start at 6 per cent for small investments and then go down sharply as the amounts involved increase. A \$2,000 purchase should cost you about \$25.

How Much Shall I Invest?

(See "Dollar Averaging Table," page 133.)

Investing is a long-time thing, for the simple reason that the vast majority of investors come from the ranks of the "another-day, another-dollar" folks.

Building our investment stake is a long-time "do-it-yourself" project.

What is the best system for timing our investments, in what amounts?

Q. I am 21, working on my first job. Can save about \$1,000 a year. Would like to buy a share of stock every time I get the money. How about General Motors?

A. General Motors is a fine choice, but not a share at a time. The commission cost is likely to be high. It would be far better to buy \$250 worth four times a year, thus cutting your brokerage fees way down.

Q. I have just inherited \$8,000. I've never invested before. I'd like to put it all into one stock so as to save commissions. Which would you advise?

A. All of anyone's investment funds should not be in one stock. You ought to select at least five different stocks, perhaps in as many industries. Total commissions will be slightly higher, but still constitute only a negligible percentage of your investment. And the diversification will be well worth it.

Q. We are young marrieds, 25, with a combined income of \$6,200 a year. We have insurance, plus \$1,200 in the bank, and a \$1,000 E bond—a gift. Money seems to slip through our fingers. Should we invest the \$1,200 in stock?

A. No, you need at least that much in an emergency cash fund, but if you have difficulty in saving, sign up on a monthly investment plan, either with a mutual fund, or a New York Stock Exchange firm. The regular payments may help you set up a savings pattern.

Q. I would like to build up to 100 shares of U. S. Steel, buying 10 shares whenever the price is low. What do you think of the plan?

A. You're asking for trouble. Who's going to ring a bell when the price is low? One hundred shares of Steel currently would cost about \$6,500; ten shares \$650.

You would find it more advantageous if you bought \$325 worth every 3 months. Total commissions would be a few dollars more a year but you would have the distinct advantage of "dollar averaging."

Q. We are in our 40's, with three children; have been able to save only \$1,000, but just received \$1,000 annual wage increase. Recently sold farm-land for \$3,000. Want to put it into stocks for income. What do you advise?

A. Put the \$3,000 into a savings bank at 3 per cent or a Federally insured savings and loan at 4 per cent. With the \$4,000 in the bank you will have a comfortable nest egg earning 3 to 4 per cent which is only \$40 to \$80 a year less than you could get in high quality income stocks. With that foundation you will then be entitled to take a bigger risk in increasing your capital by putting \$500 of your wage increase every six months into some good growth stocks of leading companies in the electronics, light metals, atomic energy, glass and aviation fields.

Q. My wife and I, both working, have accumulated sufficient insurance and savings and now would like to start buying stock, but don't know how to schedule our purchases. Is this a good time to start, or are we headed for deflation and lower prices?

A. Securities buying is not different from any other form of investment. You put \$10 or \$20 in the savings bank or bought E bonds whenever you had the money. Do the same with stocks. If you can accumulate a convenient sum—\$300 or so—every 3 months, buy the shares you like every three months.

Q. I am near 40, married, two children, earning \$20,000 to \$25,000 a year, have life insurance and 100 Avco. Can invest \$25 a week. Should I buy stocks or build savings in bank?

A. If you don't have at least \$5,000 in savings you ought to accumulate that much before you even think of stock. Thereafter you might consider putting \$300 quarterly into some good grade growth stocks in the aircraft, oil, chemical or electronic field.

What Securities Are Best for Me?

(See "Mutual Funds," page 127.)

Abraham Lincoln said a man's legs should be long enough to reach from his body to the ground.

What are your needs? Income, growth of capital, safety of principal?

Q. I am 31, married with 1 child, earn \$200 a week as an electrical engineer; have a home, savings account and insurance. Would like to start investing, buying 3 shares of A.T.&T. every six months. What is your opinion?

A. A.T.&T. is one of the top quality common stocks from the point of view of safety and stability. It has paid the same dividend, \$9 a share, for more than 35 years. But I don't see it as the investment for you.

In the first place, the dividend income will mean very little to you because it will be taxable in your highest bracket and because you are already earning a comfortable income.

With 30 years of investing ahead of you before retirement, it seems to me you could do better by investing in growth stocks which may pay little or no dividends now, but, by plowing back earnings into the business, may increase the value of your investment substantially by the time you get ready to call on your money for retirement support.

Q. My husband is 73 and I am 68. We get about \$120 a month in Social Security and have \$12,000 in E bonds. How could we go about increasing our income?

A. The \$12,000 in E bonds is earning about \$360 a year but you are not getting it now, when you need it, because these bonds pay no current interest. They should be cashed in and the proceeds put into A.T.&T. which will yield you about \$600 a year, or \$50 a month.

Q. We are both school teachers eligible for retirement next year. Our combined pensions will keep us quite comfortable but we would like some extra income, if possible, for travel. In addition to life insurance we have \$4,000 in E bonds and \$28,000 in savings accounts at 2½ and 3 per cent. What would you advise?

A. Since you already have a solid retirement pension base you can afford to take some risk with your funds in order to get higher than average income.

Continue holding the E bonds. You can cash them in after you retire, when the gain in their value will be taxable at a much lower rate than you now pay. Besides, they serve as a cash reserve. The \$28,000 should be switched into high in-

come securities yielding 6 or even 7 per cent. Most of these high income securities are not as safe as those yielding only 5 per cent, their dividends are not as stable, the industries they represent are cyclical—that is, have periods of good and bad business. But over the long term they average higher dividends than such steady earners as the utilities, food and insurance companies. Since you are relying on this additional income for "luxuries" any periodic drop in dividends would not seriously affect your living standards.

Q. I am a young man of 24, earning \$85 a week. I have \$200 in the bank and would like to begin buying stock. What kind of stock would you suggest? Don't intend to get married for 5 years.

A. \$200 in the bank doesn't seem enough; \$1,000 would be more like it, no matter when you intend to get married. (Besides, a young man's decision on this big step is not the determining one.)

Build up the equivalent of three to four months' salary, then begin buying growth stocks. Buy them indirectly through a mutual fund or directly on a monthly, quarterly or semi-annual basis, depending on how often you can accumulate \$300 to \$400 of investable money.

Q. Eight years ago, when my husband died, I put the \$50,000 proceeds from his insurance into insured savings bank accounts. He had lost money in stocks in the depression and had warned me never to buy stocks again. I find, however, that it is becoming increasingly difficult for me to live on my interest, about \$1,250 a year. What can I do?

A. Where your husband once lost by a decline in the market, you have lost by a decline in the dollar. The purchasing power of your \$50,000 is now closer to \$35,000—\$40,000 than it is to the \$50,000 you put into the banks and the buying power of your interest income has gone down correspondingly.

There is no 100 per cent safe investment. You can't deep freeze dollars.

To get more income out of your funds you will have to take most of them—but not all—out of the bank and put them to work. By dividing the money between stable common shares and good grade bonds you should be able to raise your annual income to about \$2,500 and still have funds working on either side of the inflation-deflation line.

The common-share half should be put into high grade utility, merchandising, food, tobacco shares. The other half should

go into top grade railroad and utility bonds and insured savings and loan accounts paying 4 per cent. The latter funds, in addition to earning 4 per cent, would also serve as your emergency cash reserve.

Q. I am a merchandising executive of 45 earning \$28,000 a year; married, no children. Have been buying bonds for 10 years on the payroll deduction plan because that is the best way for me to save. Would you suggest any other securities?

A. The bonds, in a way, are another form of cash fund, which can be retained in lieu of savings, although even at today's 3½ per cent rate E bonds do not yield as much as a savings bank until nearly their 5th year.

You should switch your weekly deduction into common stocks, buying them directly or via mutual funds (see "What About Mutual Funds," see below) and into tax-exempt municipal bonds. Because you are in a high tax bracket, don't look for stocks yielding high income now. What you want first and foremost is growth—stocks which will rise in value over the next 20 years. Make your choices from the electronic, light metal, chemical, oil, aircraft and related growth fields.

The municipals, of course, are hardly a growth security but a fixed value, fixed income bond. However, in current markets they are selling at substantial discounts from their maturity value. If you buy a good grade issue you have a safe bet it will be paid off 100 cents on the dollar at maturity which can mean a value gain of as much as 15 per cent over current prices. In addition their yield is not only historically high, but tax exempt. In your case this feature adds 35 to 40 per cent to their income value.

Q. My husband in recent weeks has been receiving letters from Canadian brokers offering shares in a mining stock at \$1. The last two nights he has received a telegram and then a phone call. What can you tell me about this broker? Is he dependable?

A. I wouldn't know him from Adam. But I can tell you a lot about him. His office

is in a back room in a building in Toronto, Montreal, Saskatchewan (choose one). His equipment consists primarily of a sucker list and a mimeograph machine—and a vivid imagination.

His letters start out by pointing up the virtues of International Nickel, or Kennecott, in order to prove he handles only quality issues. But when you are lulled into carelessness by his discussion of blue chips, he slips in the come-on for the junk he is trying to unload on you.

In 1990 we may well be living in a world of undreamed of automation, chemistry, light metals, atomic energy, synthetics, travel. None of your investments will give you much of a share in that future. You should look more to that future and de-emphasize today's stability and dividends. Even if you make a mistake in an investment you will have plenty of time to correct your course.

Q. I am confused by the fact that some stocks will yield only 5 per cent while others issued by companies just as well-known pay dividends amounting to 6 and 7 and even 8 per cent. American Telephone & Telegraph for example, as against the Pennsylvania R.R. and Bohn Aluminum.

A. When money goes to work its wage is set by the risks it must take. A.T.&T. has paid a dividend every year since 1881 and for the last 35 has paid a steady \$9 a year. This stability, abetted by the fact that it is a basic utility, enjoying a monopoly, attracts investors to it who are willing to accept only 5 per cent for the use of their money.

Both Pennsy and Bohn Aluminum are good companies, also. Pennsy has paid dividends every year for more than a century and Bohn for more than 30 years. But their business, revenues, profits and dividends have been nowhere as stable as A.T.&T.'s. They vary with competition in their own industries, with the general state of business, etc. As a result the investor who puts his money into Bohn will demand a higher rate of return than he will accept from A.T.&T.

What About Mutual Funds?

One of the most interesting developments of the last quarter century has been the rise of mutual funds. The first were formed—in this country—in the Twenties, but the main army came along in the Forties when increased money in circulation combined with war-time shortages of goods stepped up savings. Today

there are more than 125 mutual funds in operation in this country and their total assets are about \$10 billions.

The mutual funds are investment clubs on a giant and professional scale. They are pools of capital running from a few millions to over a billion dollars. Anyone can join by paying the going price for the

shares; anyone can quit by turning in his shares for redemption. The fund always stands ready to sell new shares (therefore its designation as an "open-end" fund); is ready to redeem the shares of those who want to leave. The shares are not traded on the securities markets, but are bought from and sold back to the fund.

The mutual fund offers several advantages: professional management of funds, diversification of investment, the regularity of monthly purchases—of extreme importance in setting up good investing habits and the convenience of having to keep track of only one security.

Those who need additional pressure to save, can pick a "contractual" plan. These, running for 10 years, charge off about one half the entire plan's commissions against the first one to two years' payments, so that if you should quit before the completion of the plan you will suffer quite a deficit in commissions paid, but not used. Statistics prove that this type of plan has been very helpful in keeping investors "in line."

All these features, of course, cost you money. You pay a commission of anywhere from zero to 9 per cent when you buy. (This same commission, however, generally includes the fee for redemption.) In addition there is a continuing annual charge reckoned as a percentage of the total amount of money in the fund.

The question of whether you should buy mutual funds or do your own securities selecting depends upon yourself in just about the way you decide whether you will paint the playroom yourself or call in a professional.

If you have no inclination to study and analyze, no patience with figures, no time and no interest in corporate and business affairs, perhaps the mutual fund offers you a safer way to handle your problem.

Not that you can pick a mutual fund blindfolded. There are funds to serve almost every purpose. Some put their money into conservative 3 and 4 per cent bonds; others buy only speculative growth stocks of the wildest type; still others aim for high current income. A young man of 24 putting all his funds into a bond account would be adding little to his future financial stature; an elderly person with sufficient capital to live comfortably would be foolish to put all his money into a mutual fund interested only in growth by 1980.

A mutual fund dividend is generally composed of two parts: an income dividend derived from the income the fund itself receives from its holdings in U. S. Steel, General Motors, du Pont, etc.; and a capital gains dividend resulting from

profits it makes on securities transactions. The latter, of course, varies widely. If the general market is in a broad downtrend, only the unusual fund management will be able to show trading profits. To the shareholder, however, these trading profits provide a distinct tax advantage. You declare only the income portion of the dividend as straight income. The capital gains portion is taxable at only half your regular rates and at never more than 25 per cent.

As a rule mutual funds—especially the larger ones—move pretty much in step with the general market. That means that in the last dozen years they have had a generally favorable background—a fact which you must keep in mind when an eager salesman is high-pressuring you into signing on the dotted line. Salesmanship in mutual funds is likely to be considerably higher pressured than in the case of a Stock Exchange house. Reason: mutual fund commissions are considerably higher, much more rewarding to the salesman.

Q. I am an Army staff sergeant with 8 years to go to retirement. I have never bought stocks because I am often out of the country for months and have no way of keeping in touch with the stock market. Still I would like to start putting some funds aside to add to my pension. Is it too late? Have \$100 a month to invest.

A. It's never too late. An eight-year investment program is better than a 7-year, and a 7-year better than a six.

A mutual fund would be ideal for your purpose, since it would relieve you of all bookkeeping, safekeeping of securities, receiving and banking dividends, etc.

Select a mutual fund that suits your purpose. Better yet, select two—one which specializes in growth stocks; another which has demonstrated its ability over the last 10 years or more of earning and paying out high income. This is, of course, a compromise. But all investing is a compromise between what you want and what you get for what you want to pay. If you put \$50 a month into each, all you have to do is send the two checks and the funds will do the rest.

Q. My son is in the Army. He sends me his monthly check and asked me to invest it for him. He will be out in 2½ years and then plans to marry. Would you advise a mutual fund?

A. No. If he is going to need this money to set up a home in 2½ years, there is no point putting it into a fund—or any form of stock investment—now. The best place for his money is in a savings account.

Q. A mutual fund salesman has insisted

he can show me that I can double my money in 10 years with no risk. What should I do?

A. Show him to the door. He's being dishonest. No one can predict market action ten years in advance. No investment is risk free.

Q. Are mutual fund investors guaranteed against loss? I notice a very large, reputable bank receives the payments for my fund.

A. No mutual fund, bond, debenture, common or preferred share buyer is guaranteed against loss. No investment in the world has an absolute guaranty with the exception of U. S. government bonds, and savings insured by instrumentalities of the U. S. government—the Federal Deposit Insurance Corp. and the Federal Savings and Loan Insurance Corp.

Mutual Fund Life Insurance

Q. I have heard I can get life insurance with a mutual fund. Would it be a good idea to cash in my regular life insurance and buy a mutual fund instead?

A. No. Mutual fund life insurance is excellent and generally very reasonably

priced. But it is no substitute for regular life insurance.

For example, if you were to sign up with a mutual fund for \$50 a month for 10 years, your policy would start as a \$6,000 plan. When you had paid in \$100, your insurance protection would be reduced to \$5,900. When, after three years, you had paid in \$1,800, your insurance protection would be down to \$4,200. The last month of your 10-year plan, your insurance protection would be \$50.

If you should die at any time during the 10 years, the insurance would immediately pay the balance owing on your mutual fund program and the entire, completed fund would be turned over to your beneficiary.

If you are in the upper 40's or the early 50's, mutual fund insurance can be much cheaper than regular term insurance (although under some plans the charges can be boosted at any time if the insurance company finds the risk has become too great). But it is hardly a life-time program and should be used for what it is—insurance to assure the completion of an investment program—rather than for any form of life insurance.

What About Bonds—Government or Otherwise?

A bond is an instrument of debt. If you buy a Bethlehem Steel bond you are a creditor of the company.

At one time in our history, the gilt-edge bond was considered the prime investment. They were the widows' and orphans' safeguard. Colleges, hospital funds, church funds all were overwhelmingly committed to bonds. Common stock was for the "flashy" crowd. The last quarter century has changed all that.

When the Great Depression hit in full force, many gilt-edge bonds went the way of stocks. And when the recovery and inflation set in, it did not take investors long to discover that bonds may be more stable than common stocks, but when they were so stable that they could not keep up with the constantly mounting cost of living they were no longer doing their job as the perfect investment. Where does that leave bond investing today? Answer: It is still a proper part of many person's investment diet, but only a part.

Q. I have two youngsters, 8 and 11. Their grandparents have given them \$500 each. I was thinking of buying them E bonds, to help prepare for their college education. What would you advise?

A. In the next nine years, \$500 worth of E bonds will be worth a third more. Of

that you can be sure. But, you then have to ask yourself, how much college education will you be able to buy with about \$680? You might as well put the money in a savings bank where you can begin drawing 3¼ per cent immediately rather than having to wait nearly 9 years to average that amount.

But beyond the actual rate of return is the question of investment purpose. You can't expect two youngsters to get very excited about E bonds. If these boys are interested in railroads, or jet fighters, or chemistry, or radio-TV, or ships, don't you think they could get a lot more satisfaction out of receiving reports from—and even attending meetings of—the Chesapeake & Ohio, or McDonnell Aircraft, or Union Carbide, or Radio Corp., or American Export Lines than from a small certificate tucked away in your strong box which they will never see?

Let's look at it this way. The \$500, or the \$680 will be neither here nor there when college tuition comes due. Why not give it a chance to do an educational as well as an investment job?

Q. When my husband died 7 years ago I was advised to put the \$40,000 insurance into H bonds. But now I find I can't live on it. What would you advise?

A. At least half the fund should be put to work in stocks yielding 5 and 6 per cent, which is at least 50 per cent more than the bonds are yielding.

Q. If, for example, a Missouri Pacific RR bond yields better than 6 per cent, why do people buy railroad common stocks? Wouldn't the bond be safer?

A. The bond is safer. But it is not as inflation proof as common stock. The Missouri Pacific 4½'s, for example, yield \$42.50 per year—period. It's true that's a good yield. But that's all it's ever going to be, no matter how much inflation we may run into.

If you are interested in railroad investments, such a bond—and the liens of other roads in this category—certainly have a place in your portfolio. But not to the exclusion of the more elastic common shares.

Q. We are retired on a small pension, plus Social Security. Friends have told us that there are bonds which are tax exempt. What are they and why wouldn't they be a good idea for us?

A. Interest paid on bonds issued by town, city and state governments, by highway, bridge and port authorities, by public school districts, by municipal water systems is exempt from Federal taxation. That's in the Constitution.

This provision makes these bonds—commonly called "municipals"—an ideal investment for wealthy persons in the 40, 50 and higher per cent income tax brackets. Today many of these bonds which, incidentally, enjoy a fairly high degree of safety, yield 3 per cent and better. To a man in the 50 per cent income tax bracket that is as good as 6 per cent from a common stock which is not likely to have the same degree of safety.

But unless you are in a substantial tax bracket (and it may be at your advanced age—with double exemptions and special medical benefits—that you pay no tax at all) the municipal bond represents a reduction in income with no offsetting tax benefits. In other words, why give up 1 or 2 per cent for tax exempt income if you are already tax exempt?

The Well-Balanced Investment Program

There is no one single perfect investment medium, any more than there is one all-purpose food, or one all-purpose automobile.

An investment program which does its job is one which will stand up in all sorts of economic weather—boom or recession, inflation or deflation. No one type of security can do that. The best program, then, must be a blend of securities. What goes into this blend?

Common stocks—they have demonstrated their ability over the years to rise in value and to increase dividend payments to shareholders as the cost of living rises. The reason is simple: A common share represents a part of a business. When prices rise, the value in dollars of various assets of a business rises—inventories, factories, equipment, patents. So each part of the business is worth more. Secondly, selling prices and percentage of profit also climb. Result: higher dividends.

Bonds—government or corporate—are your friends during time of deflation. A bond differs from a stock in that it represents a fixed claim against a company. A \$1,000 bond calls for repayment of \$1,000 when it matures and a fixed amount of interest—say \$50, every year until it comes due. If prices go down that is no concern of yours. You continue to get the \$50, and, what is more, your fixed income has greater purchasing power.

Government savings bonds possess sev-

eral advantages as well as disadvantages. The advantages: they are price fixed. You can redeem them at short notice and will get, to the penny, what a schedule of redemption calls for. Those which do not pay current income—the E's, for example—have a tax advantage for those investors who can keep them into their retirement years. It is not necessary to report annually the gain in value of these bonds. By delaying the income tax liability until your retire, when reduced earnings will either cut your income tax liability or exempt you from income taxes entirely, it is possible to make E bonds a tax-free form of investment.

Their disadvantages: their yield is relatively low; 3¼ per cent is now being paid by many large city savings banks and even 4 per cent is obtainable from Federally insured savings and loans. Their growth in value in the early years of their 9-year term is low. If you have to cash them in before the fifth year, you will get considerably less than 3¼ per cent income on your money.

Different types of securities have different advantages and disadvantages. It is up to the careful investor to mix them into his program so as to make a blend which will help him meet any economic circumstances.

"Yield" represents the annual wage your money is earning per dollar of investment. If you own \$1,000 worth of securities which

return you \$50 a year in dividends or interest, your investment is yielding 5 per cent (\$50 divided by \$1,000). A stock selling at \$40 and paying \$2 a year in dividends likewise yields 5 per cent (\$2 divided by \$40); a stock selling at \$50 and paying a \$3 dividend yields 6 per cent (\$3 divided by \$50).

In the same way a \$1,000 bond paying \$45 in annual interest yields $4\frac{1}{2}$ per cent. But if the bond is selling for only \$900, the yield advances to 5 per cent (\$45 divided by \$900).

Many investors with sentimental attachment for a stock they bought many years ago at a much lower price will hold on to it even though its current yield is far below their requirements. For example, a stock purchased at 50 and now selling at 80 but still paying \$2 in annual dividends is actually yielding only $2\frac{1}{2}$ per cent (\$2 divided by \$80) and not 4 per cent (\$2 divided by \$50) as its owner fondly recalls. If the investor requires more income, it would be good investment practice to sell the shares and reinvest them in a stock paying a higher yield on its current price.

What about Systems and Services?

Systems for "beating" the stock market are as numerous as those for "beating" the horses. The only point neither ever explains is why the discoverer—so interested in making money—is so anxious to share his system with others instead of enriching himself.

Trying to get something for nothing is one of the oldest desires known to man. Understandably, the sight of common stocks rising or falling \$2 and \$3 in a single day is an intriguing picture. "If I could only buy a stock at \$15 and sell it at \$17 the next day, I would soon be living in the lap of luxury." It sounds like an idea.

Yet the financial centers of our country are manned by thousands of well educated and experienced men and women who have all the statistics and the machinery of the market place at their finger tips and yet continue working for a living year in and year out, even as you and I. If there were an easy road to stock market riches and to a life of ease and luxury you would think they would have found it long ago. The number of fortunes made in Wall Street is hardly any more significant than the number made in the manufacture of shoes and dresses, or in marketing of vegetables or radio sets.

In addition to the get-rich-quick systems there are the thousands of advisory

services. Their value—as common sense alone would dictate—depends pretty much on what they set out to do. Obviously those who claim they can help you double your money in a fortnight—every fortnight of the year—are no better than the "beat the market" systems. Others perform a service in presenting sober discussions of economic trends and analyses of various securities which the ordinary investor could otherwise not arrive at himself.

What's an Investment Club?

An investment club is usually formed by 10 to 20 friends.

Generally an ideal program calls for monthly meetings. Officers consist of a president, vice president, secretary and treasurer-agent who should be the only one to deal with the broker.

A broker may be willing to come to several meetings to discuss securities within the limits of the club's program. But in the main, a committee appointed at each meeting is requested to bring in data on several issues for discussion. A final vote determines which one the club wants to buy; the treasurer-agent collects the monthly subscriptions and orders for the shares.

Those seeking to set up an investment club can receive invaluable help by writing to the National Association of Investment Clubs, 2224 National Bank Building, Detroit 26, Mich.

How Safe Is a Preferred Issue?

The label "preferred" on a stock issue indicates that it ranks ahead of the common stock when it comes to passing out dividends and—in case of liquidation—in distribution of assets.

That means that Company A preferred is a safer investment than Company A common. It does not mean that Company A preferred is a safer investment than Company B common because the second company may be so far superior to the first that its common shares are of better quality than the preferred share of the other. In other words, the label "preferred" is not absolute, but merely relative as an indicator of value.

There are many classes of preferred: straight preferred, cumulative, convertible, participating—to name the most common.

The straight preferred promises to pay a regular dividend of, say \$3 every year in four 75 cent payments. However, if the company has a bad year, the preferred dividend may be omitted.

The cumulative preferred holds the same position except that it promises to make up any omitted dividends before paying the common anything.

The label convertible indicates that the preferred share may be converted—at option of the investor—into a certain number of common shares. If the corporation enjoys a boom and the common begins to climb, he can turn in his preferred shares and take the common.

Participating preferreds, rather rare, allow the holder to share in any boom time bonanzas by calling for extra dividend payments after the common has received its payments.

What Is "M. I. P."?

A few years ago N. Y. Stock Exchange brokers initiated an investment plan whereunder persons able to save as little as \$40 every three months could systematically buy any stock listed on that exchange on a pay-as-you-go basis. It is called the "monthly investment program," although it also makes provisions for quarterly payments.

It is most important to realize from the first that this is NOT installment buying of securities, in the same sense that you buy a refrigerator or an automobile on the installment plan. Under M.I.P. you acquire only the exact number of shares—figured to 4 decimal places—that you have paid for. At any given moment you do not owe the broker anything. You are not committed to buy anything for any amount over any length of time. You merely express your desire to invest in, say, General Electric, at the rate of \$40, or \$50 or \$70 a month. And as long as you keep sending in your monthly checks the broker keeps buying you as much General Electric stock as your payment, less commissions, will cover.

Commissions are computed at the regular rate for all stock buying and selling on the exchange, which calls for about 6 per cent on amounts less than \$100.

If you continue the plan for any length of time you may build up to, say, 25 shares of G. E. at which point you tell the broker to begin applying your payments toward the purchase of U. S. Steel, or General Motors, or National Dairy. In fact, you may set up a program whereby you can buy G. E. with one month's payment, Steel with the second and General Motors with the third. And then start the cycle all over again with G. E. the fourth month.

But no matter what you buy, in what amounts, or whether on a monthly or quarterly frequency, you are buying the stock on a pay-as-you-go basis, not an installment plan. Whatever shares and fractions of shares you acquire are yours as completely as is a fully paid automobile or TV set. There is no margin involved. It is your property, completely. You own it, you can vote the shares, you receive the dividends. You can sell it whenever you please.

What's a Growth Stock?

Industry in this country is generally believed to be growing at the overall rate of 3 per cent a year. A "Growth" company is one which has shown a record of expansion—volume of business, net profit—greater than 3 per cent a year.

The aircraft, chemical, atomic energy, light metal, jet fuel, electronic, drug and airlines are all industries generally described as "growth" fields; whereas railroads, utilities, building material, gold mining, textiles and liquor stocks are usually denied this appellation. However, over the years, it has been possible to lose money in the first group and make it in the second.

The term at best is a loose designation, and should never blind an investor to the necessity of looking into each security individually.

How to Read a Stock Table

45 $\frac{1}{2}$ % 39 $\frac{3}{8}$ % Am Can 2 53 42 $\frac{3}{8}$ % 42 $\frac{3}{4}$ % 42 $\frac{1}{8}$ % 42 $\frac{1}{4}$ % — $\frac{1}{8}$

You can learn the going price for your stock every day. Tables showing N. Y. Stock Exchange transactions are carried in one form or another in hundreds of daily newspapers. They read something like the figures shown above.

What does all this mean? That the range in price for American Can Co. stock this year has been 45 $\frac{1}{2}$ % high, 39 $\frac{3}{8}$ % low. It pays an annual dividend of \$2 per share. That

in the day covered by the table, 5,300 shares of the stock changed hands. The first trade of the day was at 42 $\frac{3}{8}$ % (\$42.375 a share.) Later in the day it sold for as high as 42 $\frac{3}{4}$ % (\$42.75 a share) and as low as 42 $\frac{1}{8}$ % (\$42.125) and that the last trade of the day was at 42 $\frac{1}{4}$ % (\$42.25). At that price it was $\frac{1}{8}$ % (12 $\frac{1}{2}$ cents a share), below the closing price of the previous day, which must have been, of course, 42 $\frac{3}{8}$ %.

The line may be complicated by the letters "xd" after the dividend rate. This indicates that the buyer who acquired the stock today does not get the current dividend which was credited to the person who held title yesterday. The stock, in other words, is "xd" or "ex-dividend" today. In the cases where a regular dividend rate is not maintained, the dividend figure will be followed by a letter "a," "b," "g" or any other used by that particular newspaper. Reference to the footnotes will explain that the dividend figure given is augmented by payments in the form of additional shares, or that this is the amount paid so far this year, or the amount paid last year, etc.

What Are the Averages?

The best known, most often-quoted index to the course of the stock market is the Dow-Jones Industrial Average.

This is a figure compiled from prices of 30 leading common stocks on the N. Y. Stock Exchange, including such world famous companies as U. S. Steel, General Motors, American Can, American Telephone, Eastman Kodak, Chrysler, Standard Oil of N. J., Woolworth, etc.

A similar average, based on the price of 20 railroad stocks, is called the Dow-Jones Railroad Average and a third, based on the price of 15 big utilities, provides the index for that field.

What's Dollar Averaging?

It's a system of buying securities by the dollar's worth, instead of the number of shares, in exactly the same way we may say "three dollars worth" when we draw up at a gas pump, instead of "8 gallons." By using this system—in buying stocks or "gas"—you get more shares, or gallons, for your money when the price is low and less gallons when the price is high. The total result is lower average price per unit. Here's how it could work out in stocks:

Purchases	Price of stock	By dollar averaging \$500		By 10 share units	
		Shares bought	Cost	Shares	Cost
1st.....	\$50.00	10	\$500.00	10	\$500.00
2nd.....	60.00	8	480.00	10	600.00
3rd.....	65.00	8	520.00	10	650.00
4th.....	45.00	11	495.00	10	450.00
5th.....	30.00	17	510.00	10	300.00
6th.....	35.00	14	490.00	10	350.00
7th.....	40.00	13	520.00	10	400.00
8th.....	45.00	11	495.00	10	450.00
9th.....	50.00	10	500.00	10	500.00
Totals.....	102	\$4,510.00	90	\$4,200.00
Average cost.....	\$44.28	...	\$46.66

Glossary of Investment Terms

AT THE MARKET: An order to buy or sell "at the market" calls for its execution at the best possible price on the trading floor at the time the order arrives.

BEAR: Someone who believes the market will decline.

BID AND ASKED: The bid is the highest price anyone wants to pay for a security at a given time; the asked is the lowest price anyone will take at the same time.

BLUE CHIP: Common stock in a company known for wide acceptance of its products or services and for its ability to pay dividends in good times and bad.

BOND. Basically an IOU or promissory note of a corporation, usually issued in multiples of \$1,000, although \$100 and \$500 denominations are not uncommon.

BULL: One who believes the market will rise.

CAPITAL GAIN OR CAPITAL LOSS: Profit or loss from the sale of a capital asset. A capital gain may be either short-term (6 months or less) or long-term (more than 6 months). A short-term capital gain is taxed at the reporting individual's full income tax rate. A long-term capital gain is taxed at a maximum of 25 per cent, depending on the reporting individual's tax bracket. Up to \$1,000 of net capital loss—that is, when you sell securities at a lower price than you paid for them—is deductible from the individual's taxable income during the year reported. If the capital loss is more than \$1,000, as much as \$1,000 annually is deductible in each of the next five years. The amount of capital

loss that may be deducted is reduced by the amount of any capital gain.

COMMISSION: The broker's fee for purchasing or selling securities or property for a client. On the N. Y. Stock Exchange commissions average about one per cent of the market value of stocks and approximately one-quarter of one per cent on bonds.

COMMON STOCK: Securities which represent ownership interest in a corporation. (For difference between common and preferred stock, see *How Safe Is a Preferred Issue?*, page 131.)

CONVERTIBLE: A bond, debenture or preferred share which may be exchanged by the owner for common stock or another security, usually of the same company, in accordance with the terms of the issue.

DEBENTURE: A promissory note backed solely by the general credit of a company and not secured by a mortgage or lien or any specific property.

DOW THEORY: A theory of market analysis based upon the performance of the Dow-Jones Industrial and rail stock price averages. The theory says that the market is in a basic upward trend if one of these averages advances above a previous important high, accompanied or followed by a similar advance in the other. When the averages both dip below previous important lows, this is regarded as confirmation of a basic downward trend.

MARGIN: The amount paid by the customer when he uses credit to buy a security, the balance being advanced by the broker. Under Federal Reserve Regulations, the margin required in the past 20 years has ranged from 40 per cent of the purchase price all the way to 100 per cent. It is currently 70 per cent.

OVER-THE-COUNTER: A market for securities made up of securities dealers who may or may not be members of a securities exchange. Over-the-counter is mainly a market made over the telephone. Thousands of companies have insufficient shares outstanding, stockholders, or earnings to warrant application for listing on a stock exchange. Others may prefer not to make public all the information which listing requires. Securities of these companies are traded in the over-the-counter market between dealers who act either as principals or as brokers for customers. The over-the-counter market is the principal market for U. S. Government bonds, municipals, bank and insurance stocks.

PAR: In the case of a common share, par means a dollar amount assigned by the company's charter for balance sheet use. Par value has little significance so far as

market value of common stock is concerned. In the case of preferred shares and bonds, however, par is important. It often signifies the dollar value upon which dividends on preferred stocks, and interest on bonds, are figured. The issuer of a 3 per cent bond promises to pay that percentage of the bond's par value annually.

RIGHTS: When a company wants to raise more funds by issuing additional securities, it may give its stockholders the opportunity, ahead of others, to buy the new securities in proportion to the number of shares each owns. The piece of paper evidencing this privilege is called a right. Because the additional stock is usually offered to stockholders below the current market price, rights ordinarily have a market value of their own and are actively traded. In most cases they must be exercised within a relatively short period. Failure to exercise or sell rights results in actual loss to the holder.

SHORT SALE: A person who believes a stock will decline and sells it though he does not own any has made a short sale. For instance: You instruct your broker to sell short 100 shares of ABC. Your broker borrows the stock so he can deliver the 100 shares to the buyer. The money value of the shares borrowed is deposited by your broker with the lender. Sooner or later you must cover your short sale by buying the same amount of stock you borrowed for return to the lender. If you are able to buy ABC at a lower price than you sold it, your profit is the difference between the two prices—not counting commissions and taxes. But if you have to pay more for the stock than the price you received, that is the amount of your loss. Stock Exchange and Federal regulations govern and limit the conditions under which a short sale may be made on a national securities exchange.

STOCK DIVIDEND: A dividend paid in securities rather than cash. The dividend may be additional shares of the issuing company, or in shares of another company (usually a subsidiary) held by the company.

TAX EXEMPT BONDS: The securities of states, cities and other public authorities specified under Federal law, the interest on which is either wholly or partly exempt from Federal income taxes.

WARRANT: A certificate giving the holder the right to purchase securities at a stipulated price within a specified time limit or perpetually. Sometimes a warrant is offered with securities as an inducement to buy.

RELEARNING MATHEMATICS

Part II—Algebra

By

MYRON F. ROSSKOPF

Professor of Mathematics, Teachers College, Columbia University

and

JOHN J. KINSELLA

Professor of Education, New York University

and

The INFORMATION PLEASE Staff

This section covering algebra is Part II of our Relearning Mathematics series, initiated in our 1957 edition.

Since a complete course in algebra would require more space than can be allocated in this edition, Professors Roskopf and Kinsella have dealt only with some of the troublesome problems in the study of algebra.

We are confident that if you understand the problems discussed here, you can manage all the problems of a standard algebra text book. At least we hope so.

We are repeating the introduction to last year's section because we believe the counsel offered applies to this section on algebra.

INTRODUCTION

This section is intended to be a refresher course for parents who are faced with the problem of helping children with their lessons in mathematics. It is primarily for the parent who studied mathematics many years ago but has, inevitably, grown rusty and lacks familiarity with current methods of instruction.

Teaching methods today are different in many respects from the methods of the past. This is an important consideration because, too often, well-meaning parents who try to help their children employ methods which are no longer in use. This obviously confuses the child and creates problems for the teacher.

We strongly counsel parents who may try to help their children with the aid of this section not to attempt it without proper preparation. You may find, when you turn to our refresher course, that you need a little time to get the hang of it yourself. In other words, don't wait until your boy or girl comes to you with a problem. We suggest that you give yourself a reasonable amount of time in advance to study the entire section and then give special attention to the specific grades that your youngsters are currently attending.

While our emphasis is on helping children at school, we also have included instruction on pre-school training which will enable you to prepare the four-year-olds, bless them, for kindergarten matriculation.

It was our endeavor to provide a simple, concise and useful course in mathematics, which would help not only parents with their children but which would also revive the interest and improve the understanding of any adult.

See end of this section on page 157.

DAN GOLENPAUL, Editor

As you talk with your senior high school student's mathematics teachers at parent-teachers meetings or in conferences, you will become aware that these teachers are more interested in explaining the *why* of mathematics to him than in cramming his head with formulas, rules, and facts.

Such an approach to teaching mathe-

matics is relatively new. These pages reflect this new point of view. If you, as a parent, are to be able to help your child overcome some of his difficulties in algebra or geometry or trigonometry, you must be familiar with the new approaches. You will want your help at home to fit in with the instruction that your child receives in school.

Why Study Algebra?

During the 9th grade your boy or girl will be busy studying algebra. You will hear remarks about finding "x" and using letters instead of numbers. You may be challenged with the question, "Why do we have to take algebra?"

Algebra is necessary for many occupations. This is obvious in professions like engineering and architecture, but not so obvious in medicine, dentistry, pharmacy, or nursing. However, those professions require preparation in physics, chemistry, and biology. Clearly, algebra skills and the thinking that is a part of algebra are essential to an understanding of any one of the sciences mentioned.

Modern business and manufacturing require algebra to solve important problems. The price of a given product depends upon the number of units sold and the costs per unit. What price will lead to the largest

sales with the smallest costs? Algebra helps to solve that problem.

Success in manufacturing a product depends upon maintaining a consistent quality. Here probability and statistics enter the picture. Algebra is basic in a study of these mathematical sciences.

Insurance, accounting, and investing use the ideas developed in algebra. Today, skilled craftsmen—carpenters, machinists, electricians and plumbers—can benefit from a study of algebra. Their work is becoming more technical with the increased complexity of building materials and appliances.

A person in our modern world who is not familiar with the symbolism of algebra is akin to a visitor to a country whose language he does not know. Just as a child stumbles in his first efforts to learn a language so a child's first stumbling block in algebra may be the use of symbols to represent numbers.

What Symbols Mean

An effective device to help your child understand algebraic symbols is to point out to him the wide use of symbols in everyday life. A symbol is something that stands for something else. It may be a word, a mark, a letter, a numeral, a sign, an abbreviation, a gesture, or any other means of communication that suggests something because of a resemblance, a relationship, or a convention. Some symbols are so familiar that we do not think about them at all. The lights at a street intersection, the signals of a traffic policeman, the center line

of a highway, are symbols that a driver of a car must interpret correctly.

Your child is already familiar with symbols representing arithmetic processes like "+," "−," "÷," "×," "√." The letters used in algebra stand for numbers. By writing

$$c = np$$

where *c* represents the total cost, *n* the number of articles bought, and *p* the price of each article, we have a formula that summarizes a host of individual problems from arithmetic.

Laws of Arithmetic

Through the first eight grades, your beginning algebra student has learned to understand and to work with numbers like these:

$$8; 15; 9,678,105; \frac{3}{4}; \frac{5}{16}; 1.7; 0.625$$

He found that

$$3 + 5 = 8 \quad \text{and} \quad 5 + 3 = 8$$

$$16\frac{3}{4} + 5\frac{1}{2} = 22\frac{1}{4}$$

$$\text{and } 5\frac{1}{2} + 16\frac{3}{4} = 22\frac{1}{4}$$

$$46.2 + 35.7 = 81.9 \text{ and } 35.7 + 46.2 = 81.9$$

That is, the *order* in which addition is done does not affect the sum. You can interchange the two numbers, add, and the same answer results. The examples are illustrations of the *commutative law for addition*. By using symbols, the law can be summed up in one line: For all numbers a and b ,

$$a + b = b + a$$

There is a *commutative law for multiplication*, too. Look at the examples:

$$\begin{array}{l} 2 \times 3 = 6 \quad \text{and} \quad 3 \times 2 = 6 \\ \frac{1}{2} \times \frac{3}{5} = \frac{3}{10} \quad \text{and} \quad \frac{3}{5} \times \frac{1}{2} = \frac{3}{10} \\ 1.2 \times .6 = .72 \quad \text{and} \quad .6 \times 1.2 = .72 \end{array}$$

Again, with the use of symbols, all examples are wrapped up in a single statement: For all numbers a and b ,

$$a \times b = b \times a$$

There are several ways to write a multiplication in algebra. Sometimes parentheses are used,

$$(3)(4) = 12$$

Notice that the sign for multiplication " \times " is omitted. Another way to write the product is to use a center dot " \cdot " as in the following example:

$$4 \cdot 5 = 20$$

Whenever there is no danger of misunderstanding the center dot is omitted:

$$3 \cdot a = 3a; x \cdot y = xy$$

and the number and letter, or letters, are written next to each other to indicate a multiplication. Of course, the center dot could not be omitted in

$$4 \cdot 5$$

for then there would be confusion with the number "45."

When your child had to add three or more numbers, he discovered that he added two of them first; then he added the third to their sum. Through many examples, he

learned that it made no difference which two numbers he added first: the total sum was the same. Add:

$$\begin{array}{r} 3 \quad 3 + 7 = 10 \quad 9 + 7 = 16 \\ 7 \quad 10 + 9 = 19 \quad 16 + 3 = 19 \\ 9 \end{array}$$

Or, we can write the example:

$$\begin{aligned} (3 + 7) + 9 &= 10 + 9 \\ &= 19 \\ 3 + (7 + 9) &= 3 + 16 \\ &= 19 \end{aligned}$$

The way in which the numbers are associated does not affect the sum. This is true of any three numbers and is the *associative law for addition*. In symbols we have: For all numbers a , b , and c ,

$$(a + b) + c = a + (b + c)$$

There is an *associative law for multiplication*. That is, when we multiply three or more numbers, we multiply them two at a time. We associate them. For example,

$$\begin{aligned} (3 \times 4) \times 6 &= 12 \times 6 = 72 \\ 3 \times (4 \times 6) &= 3 \times 24 = 72 \end{aligned}$$

In general, for all numbers a , b , and c ,

$$(ab)c = a(bc)$$

The last law from arithmetic that is explicitly stated for algebra students is the *distributive law* of multiplication when adding. Whenever your child does a long multiplication, he is using the distributive law—even though he may not realize it. The law says: For all numbers a , b , and c ,

$$a(b + c) = ab + ac$$

As an example, consider

$$\begin{aligned} 3(4 + 5) &= 3 \cdot 4 + 3 \cdot 5 \\ 3 \cdot 9 &= 12 + 15 \\ 27 &= 27 \end{aligned}$$

We can add first; then multiply. Or, we can multiply first; then add.

Directed Numbers, + and -

Very early in the ninth grade your child will be studying *directed numbers*:

$$\begin{aligned} +2; +17; -3; -16; \\ -1.5; +2.35; -\frac{2}{3}; +\frac{5}{16} \end{aligned}$$

We shall want the laws of arithmetic—the associative, commutative, and distributive laws—to apply also to this new kind of number. That is the reason for mentioning those laws.

An excellent way to interpret directed

numbers is through the use of an east-west road with markers at one-mile intervals.

Trips from C to L or A to B or H to M are all trips of 3 miles east. As a symbol for these trips, use $+3$. Trips from E to F or L to C or G to L are all trips of 3 miles west. As a symbol for these trips to the west, use -3 . Now, you can give interpretations for a trip in either direction in terms of a directed number.

At any point in mathematics where a new kind of number is introduced, you learn how to operate with these numbers; that is, how to add, subtract, multiply and divide two of these numbers. Addition can be interpreted very nicely through the use of the east-west road with milestone markers.

Consider addition. A trip is made from F to E and then from E to L. What is the mileage? Of course, it is 5 miles east. But let us make an interpretation in terms of directed numbers; it is

$$(+3) + (+2) = +5$$

If a trip is taken from K to L and then from L to A, the total mileage is 6 miles west. In terms of directed numbers, the trips can be interpreted as

$$(-2) + (-4) = -6$$

From a number of examples of this sort, your child can develop a rule for adding two directed numbers with like signs.

Now, let us consider a trip that involves going first in one direction and then in the other direction, say a trip from D to B and then a trip from B to A. This is 5 miles east followed by 3 miles west, or

$$(+5) + (-3) = +2$$

since the traveler will be 2 miles east of his starting point. A trip from K to A and then from A to B is a trip 6 miles west followed by a trip 3 miles east; the traveler ends up 3 miles west of his starting point. In our symbols, the interpretation of the problem is

$$(-6) + (+3) = -3$$

Again, after a number of examples of this sort, a rule for operating correctly can be formulated.

Although subtraction can be explained by

using an east-west road, a better way is to make use of what your child knows about subtraction of whole numbers. Fundamentally, finding the difference of two numbers, say 16 and 9, is the problem of finding what number added to the second gives the first. That is, $9 + ? = 16$; the answer, of course, is 7. The process is related to the check of subtraction:

$$\begin{array}{rcl} 16 & \leftarrow & \text{minuend} \\ -9 & \leftarrow & \text{subtrahend} \quad \rightarrow 9 \quad \left| \quad \text{add} \\ \hline 7 & \leftarrow & \text{difference} \quad \rightarrow 7 \quad \downarrow \\ & & 16 & \leftarrow & \text{minuend} \end{array}$$

In words, the difference is the number that is added to the subtrahend in order to yield the minuend.

Let us make use of this idea in subtraction of directed numbers. There are the following six types of subtraction examples:

(A)	(B)	(C)	(D)	(E)	(F)
$+3$	$+7$	$+7$	-3	-3	-7
$+7$	$+3$	-3	$+7$	-7	-3
<hr/>	<hr/>	<hr/>	<hr/>	<hr/>	<hr/>

In type A, *think*, what number added to $+7$ yields $+3$? Since the minuend is smaller than the subtrahend, the number must be negative. The answer or difference is -4 .

For type B, *think*, what number added to $+3$ yields $+7$? The minuend is larger than $+3$. Hence, the difference is $+4$.

Type C is a bit more difficult. *Think*, what number must be added to -3 to yield $+7$? Again the minuend is larger than the subtrahend; so the answer will be positive. But from -3 to $+7$ is 10 steps; therefore, the answer must be $+10$.

The only difference between Type C and Type D is that the answer is negative. *Think*, what number added to $+7$ yields -3 ? Since the minuend is smaller than the subtrahend, the answer must be negative. It is -10 .

For Type E, *think*, what number must be added to -7 to yield -3 ? Since -3 is larger than -7 , the answer must be positive. We know that $(-7) + (+4) = -3$; hence, the answer is $+4$.

Types E and F are related. *Think*, what number must be added to -3 to yield -7 ? Since -7 is smaller than -3 , the answer is negative. We know that $(-3) + (-4) = -7$; so the answer is -4 .

Better than a rule for subtracting two directed numbers is the principle on which subtraction is based. Of course, you can

make a rule if you wish, but be sure that first your child understands the basis for the rule.

Let us see if addition of directed numbers is such that the commutative law holds:

$$\begin{aligned} \text{and} \quad (+3) + (+2) &= +5 \\ (+2) + (+3) &= +5 \end{aligned}$$

$$\begin{aligned} \text{and} \quad (-3) + (+4) &= +1 \\ (+4) + (-3) &= +1 \end{aligned}$$

$$\begin{aligned} \text{and} \quad (-2) + (-5) &= -7 \\ (-5) + (-2) &= -7 \end{aligned}$$

These examples indicate that the commutative law does indeed hold for addition of directed numbers.

What about the associative law? Let us see:

$$[(+3) + (-2)] + (-3) = (+1) + (-3) = -2$$

and

$$(+3) + [(-2) + (-3)] = (+3) + (-5) = -2$$

Another example:

$$[(-5) + (+7)] + (+3) = (+2) + (+3) = +5$$

and

$$(-5) + [(+7) + (+3)] = (-5) + (+10) = +5$$

The examples indicate that the associative law, too, applies in the case of addition of directed numbers. This is what we wanted.

At some point in your child's work in algebra, his teacher will point out that the positive numbers behave exactly in the same fashion as the whole numbers in arithmetic. The agreement is made to use $+12$ or 12 , say, interchangeably. If the agreement is not made, a ninth grader might be puzzled at sometimes seeing a $+12$ as an answer and sometimes just 12 . You must be sure that your child understands that directed numbers include the old, familiar numbers of arithmetic.

If positive numbers are to behave like the numbers of arithmetic, then we have:

$$\begin{aligned} (+4)(+11) &= 4 \cdot 11 = 44 \text{ or } +44 \\ (+44) \div (+11) &= 44 \div 11 = 4 \text{ or } +4 \end{aligned}$$

It seems reasonable to expect that the product will be positive in the case when both numbers are negative:

$$\begin{aligned} (-4)(-11) &= +44 \\ (-44) \div (-11) &= +4 \end{aligned}$$

In general, if the signs of two numbers that are being multiplied are alike, then the product is positive. If two numbers with like signs are divided, the quotient is positive.

Next, we must consider the case of multiplication or division of two numbers with unlike signs. As you might guess, the answer is negative. Look at the examples:

$$(-4)(+11) = -44$$

and

$$(+4)(-11) = -44$$

for division,

$$(-44) \div (+11) = -4$$

and

$$(+44) \div (-11) = -4$$

If two numbers with unlike signs are multiplied or divided, the answer is negative.

A few examples are sufficient to convince a youngster that the commutative, associative, and distributive laws apply. Look at the examples:

$$\begin{aligned} \text{a.} \quad (+3)(-5) &= -15 \\ (-5)(+3) &= -15 \end{aligned}$$

$$\begin{aligned} \text{b.} \quad [(+3)(-5)](-2) &= (-15)(-2) \\ &= +30 \\ (+3)[(-5)(-2)] &= (+3)(+10) \\ &= +30 \end{aligned}$$

$$\begin{aligned} \text{c.} \quad 3[(-5) + (-4)] &= 3(-5) + 3(-4) \\ 3(-9) &= (-15) + (-12) \\ -27 &= -27 \end{aligned}$$

After much practice with directed numbers in addition, subtraction, multiplication, and division, the next step is to apply the ideas when letters are used.

Operations on Polynomials

An example of a *polynomial* is:

$$9x^3 - \frac{3}{4}x^2y + 4xy^2 + 7y^3 - 13$$

A polynomial is an expression in which numbers and letters appear. The letters have positive whole numbers attached to them that indicate how many times they

are to be used in a product. For example,

$$x^3 \text{ means } x \cdot x \cdot x$$

and

$$x^2y \text{ means } x \cdot x \cdot y$$

The terms in a polynomial are separated by "+" and "-" signs.

You might say that a polynomial is an expression consisting of several terms.

Then a *trinomial* is a polynomial with three terms,

$$2x^2 - 5x + 10$$

A *binomial* is a polynomial with two terms,

$$3x + 4y$$

A *monomial* is a single term,

$$4x$$

The distributive law,

$$a(b + c) = ab + ac$$

will help us add two monomials. Consider,

$$(-3a) + 12a$$

by the distributive law, we have

$$(-3a) + 12a = [(-3) + 12]a = 9a$$

Another example is

$$(-4b^2) + (-13b^2) = [(-4) + (-13)]b^2 = -17b^2$$

Other examples are:

$$4a^2 + 2a^2 = 6a^2$$

$$4k - 12k = -8k$$

$$(-12x) - (-9x) = -3x$$

In the case of multiplication or division, observe the examples:

$$2x(-3a) = -6ax$$

$$4a \times 2 = 8a$$

$$12a \div (-4) = -3a$$

$$(-15a^3) \div (-3) = 5a^3$$

If the basic ideas are gone over carefully with your youngster, he should have no difficulty working with examples like the foregoing.

With the work on operations with monomials behind him, an algebra student has little difficulty working with polynomials. The reason is that all of the work goes back to operations with monomials, the terms of the polynomials.

For example,

$$\begin{array}{r} 4x^2 + 2x - 5 \\ (+) 2x^2 + 3x + 6 \\ \hline 6x^2 + 5x + 1 \end{array}$$

Notice that the addition is done column by column. Each column involves finding the sum of two monomials.

Subtraction, too, can be done easily because of the work with monomials:

$$\begin{array}{r} 4y^2 - 3y + 5 \\ (-) 2y^2 - 2y + 6 \\ \hline 2y^2 - y - 1 \end{array}$$

The difference can be checked by adding it to the subtrahend to see if you get the minuend.

First, we consider multiplication of a single term, a monomial, and several terms, a polynomial. Look at the rectangle below, which has a width of a , and a length of $x + y + 2$.

a	ax	ay	$2a$
	x	y	2

The areas of the small rectangles into which the large rectangle is divided are ax , ay , and $2a$. Using the same formula for area of a rectangle, length times width, and applying it to the large rectangle, we find its area is $a(x + y + 2)$. Yet, the area of the large rectangle equals the sum of the areas of the rectangles into which it has been divided; hence,

$$a(x + y + 2) = ax + ay + 2a$$

So, to multiply a polynomial by a monomial, multiply each term of the polynomial by the monomial.

$$4x(x - 2y - 3) = 4x^2 - 8xy - 12x$$

Second, consider the multiplication of two binomials. The rectangle below has a width

of $a + 5$ and a length of $2a + 3$. As in the foregoing illustration, the area of the big rectangle equals the sum of the areas of the small rectangles into which it is divided. The sum of the areas of the small rectangles is

$$2a^2 + 10a + 3a + 15 \text{ or } 2a^2 + 13a + 15$$

The area of the big rectangle is

$$(2a + 3)(a + 5)$$

and it must equal the sum of the areas of the small rectangles. Hence,

$$(2a + 3)(a + 5) = 2a^2 + 13a + 15$$

Multiplication is easy if the work is arranged like a long multiplication example in arithmetic:

$$\begin{array}{r} 2a + 3 \\ (\times) a + 5 \\ \hline 10a + 15 \\ 2a^2 + 3a \\ \hline 2a^2 + 13a + 15 \end{array}$$

The form for division bears a close resemblance to long division in arithmetic. If you did the example

$$(4x^2 + 4x - 3) \div (2x + 3)$$

you would most likely write:

$$\begin{array}{r} \text{di-} \quad \quad \quad 2x - 1 \quad \leftarrow \text{quotient} \\ \text{visor} \rightarrow 2x + 3 \overline{) 4x^2 + 4x - 3} \leftarrow \text{dividend} \\ \quad \quad \quad 4x^2 + 6x \\ \quad \quad \quad \hline \quad \quad \quad - 2x - 3 \\ \quad \quad \quad - 2x - 3 \\ \quad \quad \quad \hline \end{array}$$

First, *think*, what is $4x^2$ divided by $2x$. It is $2x$. Then multiply:

$$(2x + 3)2x = 4x^2 + 6x$$

Now, the product is subtracted from the dividend:

$$(4x^2 + 4x - 3) - (4x^2 + 6x) = -2x - 3$$

In the next step, $-2x - 3$ is used as a new dividend. *Think*, what is $-2x$ divided by $2x$? It is -1 , and -1 becomes the next term of the quotient. Then multiply:

$$(2x + 3)(-1) = -2x - 3$$

The product is subtracted from the new dividend; the division is finished, for the remainder is zero.

Of course, all divisions will not come out "even." But you will know when to stop because the remainder will be a number:

$$\begin{array}{r} 5x - 6 \\ 3x + 2 \overline{) 15x^2 - 8x + 13} \\ \quad \quad \quad 15x^2 + 10x \\ \quad \quad \quad \hline \quad \quad \quad - 18x + 13 \\ \quad \quad \quad - 18x - 12 \\ \quad \quad \quad \hline \quad \quad \quad + 25 \leftarrow \text{remainder} \end{array}$$

Factoring

When you studied algebra, you may have spent much time on the topic of special products and factoring. Probably you studied many involved types of factoring and practiced on endless lists of exercises. Nowadays you will find your child studying just three types of multiplication and their corresponding three types of factoring. The

names of the types and an illustrative example for each follow:

(a) Common Monomial:

$$ax + ay + a = a(x + y + 1)$$

(b) Difference of Two Squares:

$$x^2 - y^2 = (x + y)(x - y)$$

(c) Trinomial:

$$x^2 - x - 6 = (x - 3)(x + 2)$$

Factoring is related to multiplication. Two numbers are factors of a third number if their product equals the third number. For example 5 and 3 are factors of 15, because $15 = 3 \cdot 5$. For algebra, we say two expressions are factors of a third expression if their product equals the third expression. The three examples above are illustrations.

Let us consider each of the types in turn. Study the product:

$$3x(4x + 3y + 9) = 12x^2 + 9xy + 27x$$

Notice that $3x$ is a part of each term of the right member; $3x$ is common to every term. That means it is a factor of every term. You can recognize an example that is a common monomial factoring type by looking to see if the given expression has something common to every term. For example,

$$15xyz + 5xy^2 - 40xyz^2$$

has the monomial $5xy$ common to every term. One factor is $5xy$; the other factor is obtained by *thinking*, by what must I multiply $5xy$ to yield $15xyz$? to yield $5xy^2$? to yield $-40xyz^2$? Then the factored expression is

$$5xy(3z + y - 8z^2)$$

The difference of two squares as a factoring type is easy to recognize because there are always (a) just two terms, (b) each term is a perfect square, and (c) there is a minus sign between the terms. The factors are the sum of the square roots of the terms and the difference of their square roots. For example,

$$9x^2 - 49y^2 = (3x + 7y)(3x - 7y)$$

That the product is indeed the difference of two squares can be verified by multiplication. Let us check, as in the example below, where we multiply first by $3x$ and second by $-7y$. Like terms fall under one another nicely if you multiply from left to right. You can see that the product is the

given expression. We factored correctly.

$$3x + 7y$$

$$3x - 7y$$

$$9x^2 + 21xy$$

$$- 21xy - 49y^2$$

$$9x^2$$

$$- 49y^2$$

In case your boy or girl has trouble factoring a trinomial, check to see if he understands that it is the product of two binomials. For example, the product of $(x + 2)$ and $(x + 1)$, as shown in the adjacent multiplication, is $x^2 + 3x + 2$. Just as soon as he realizes this, he knows that he must look for two binomials as factors of a trinomial. About all you can tell your child to help him to recognize a trinomial type of factoring is that there are always three terms, and there is no expression common to the terms. As an example, let us factor the trinomial

$$x + 2$$

$$x + 1$$

$$x^2 + 2x$$

$$+ x + 2$$

$$x^2 + 3x + 2$$

$$4x^2 + 4xy - 3y^2 = (2x + 3y)(2x - y)$$

Outside
 Inside

First, write the factors of the *end* terms in their proper position in the parentheses in the right member; the factors of $4x^2$ are $2x$ and $2x$ or $4x$ and x ; the factors of $3y^2$ are $3y$ and y . Now, you must place the "+" and the "-" so as to obtain the correct middle term, $4xy$. The middle term is always the sum of two products, the product of the "inside" terms and the product of the "outside" terms.

Notice that there is a choice of factors for the first term in the foregoing example. Such is often the case. The task, then, is to choose a pair of factors, making a mental check to see if the correct middle term is obtained, and accept or reject the choice of factors on the basis of your check.

Solving Equations

Your ninth grader will, perhaps, have had some instruction in the solution of equations toward the last part of the eighth grade. In algebra, more involved types of equations are solved. After directed numbers have been studied, solutions may be positive or negative and subtraction in an equation will always be possible.

The solution of an equation is a number that, replacing the letter in the equation, makes the left member equal the right member. Some of the first types of equations, together with their solutions, appear below:

$$\begin{array}{rcl} \text{(a)} & x + 5 = 2 & \\ & - 5 = -5 & \\ \hline & x = -3 & \end{array}$$

$$\begin{array}{rcl} \text{(b)} & x - 6 = 8 & \\ & + 6 = +6 & \\ \hline & x = 14 & \end{array}$$

$$\begin{array}{rcl} \text{(c)} & \frac{x}{2} = 5 & \\ & 2 \cdot \frac{x}{2} = 2 \cdot 5 & \\ & x = 10 & \end{array}$$

$$\begin{array}{rcl} \text{(d)} & 3x = -7 & \\ & \frac{3x}{3} = \frac{-7}{3} & \\ & x = -2\frac{1}{3} & \end{array}$$

Solving equations is not difficult if the emphasis is put on thinking what to do rather than on following a rule for solving that type of equation. Practice, of course, helps a child to perfect his methods. More involved equations are obtained by combin-

ing the types (a) to (d). For example, consider the following equation:

$$\begin{array}{rcl} 3x - 5 & = & 5x + 7 \\ - 7 & = & -7 \\ \hline 3x - 12 & = & 5x \\ -3x & = & -3x \\ \hline -12 & = & 2x \\ \frac{-12}{2} & = & \frac{2x}{2} \\ -6 & = & x \end{array}$$

Check: -6

Left member

$$3(-6) - 5 = -18 - 5 = -23$$

Right member

$$\begin{array}{l} 5(-6) + 7 = -30 + 7 = -23 \\ -23 = -23 \end{array}$$

This example illustrates a systematic way to solve the equation: (a) since 7 is added to the right member, to remove it we must subtract 7 from both members; (b) the result is $3x - 12 = 5x$. To remove the $3x$ from the left member, we must subtract $3x$ from both members; (c) the result is $-12 = 2x$. Now, we have a basic type of equation to solve; divide both members by 2, since we have $2x$ and want to find x . The final result is $-6 = x$. (d) The last equation is so simple that at a glance you can see that replacing x by -6 leads to the left member being equal to the right member. The check is done to see that -6 is indeed a number that makes the left member equal to the right member in the given equation.

Graphs

If your child is like other ninth grade students, he will find the work with graphs more enjoyable than some other topics in algebra. A graph is a picture; it is an aid to visualization of a relationship. By examining a picture, a graph, of a mathematical relationship more facts can be observed than from its verbal description, or its form in symbols, alone.

Suppose we have the problem: Find two numbers whose sum is 5. Is there just one pair of such numbers? Let us see. The first

number could be 3; then the second number would have to be 2 if we are to have their sum equal 5. But the first number could be 1; then the second number would be 4. So we see that there are many pairs of numbers whose sum is 5.

A few of the pairs of numbers are arranged in the table. We represent the first number by x , and the second number by y . Then the problem "two numbers whose sum is 5" is represented by

$$x + y = 5.$$

Point	A	B	C	D	E	F	G	H	I	J
If $x =$	-3	-2	-1	0	1	2	3	$3\frac{1}{2}$	4	5
Then $y =$	8	7	6	5	4	3	2	$1\frac{1}{2}$	1	0

Each of the pairs is given a letter name, too, as shown above.

Now, we want to make a picture, a graph. In a city that is laid out in squares, avenues running north and south, streets from east to west, you can give directions by saying 3 streets east and 4 avenues north. Such directions allow you to go from where you are to the place in which to look for the spot you wish to find. We can use the same plan in mathematics.

Use two number scales. Place one vertically and the other horizontally; let the two number scales cross at their zero points. Special paper, with grid lines, is helpful; it is graph paper.

Then "3 streets east and 4 avenues north" will be the point on the grid labeled "P." Any other set of directions can be found in the same way. In mathematics such a set of directions as "3 streets east and 4 avenues north" is called an *ordered pair* of numbers. Such an ordered pair is written in parentheses; the first number

(3, 4)

is understood to represent the east-west direction; the second number is understood to represent the north-south direction.

In the table we have used x and y to represent our two numbers rather than east-west and north-south. Customarily the horizontal line is called the x -axis; the vertical line is called the y -axis.

Then an ordered pair of numbers, like $(-2, 7)$ in the table, has for its picture on graph point B, where B is -2 units to the left from 0 and 7 units up from 0. The other ordered pairs are plotted in the same way and have points for their graphs.

You see that point E corresponds to the pair (1, 4) and H corresponds to the pair $(3\frac{1}{2}, 1\frac{1}{2})$. Conversely, you can read the pair of numbers that correspond to a point. For example, the pair (5, 0) corresponds to point J; (2, 3) corresponds to the point F.

If you lay a ruler or the edge of a piece of paper along the points in the graph, you will see that they lie on a straight line. It turns out that the graph of every equation like

$$x + y = 5$$

the equation for our problem, serves to form a set of ordered pairs of numbers whose graph is a straight line.

We can use letters to form

$$ax + by = c$$

Here x and y are variables; a , b , and c are symbols for numbers. Every equation of this form has a straight line for a graph; and every straight line graph has an equation of this form. That is the reason that $ax + by = c$ is called a *linear equation*. The only limitation is that a and b cannot both be zero in the same equation.

For example, in the equation

$$3x - 4y = 2$$

$a = 3$, $b = -4$, $c = 2$. Let us form the graph of this equation. First, we must obtain a *table of values*; these are the ordered pairs we need in order to make the graph.

Since x and y are variables that can be replaced by any numbers, we choose a number at random as a value for one of the letters. Then we find the value of the other number from the equation. Suppose we choose the value 1 for y . If we replace y in the equation by 1, we have

$$\begin{aligned} 3x - 4 \cdot 1 &= 2 \\ 3x - 4 &= 2 \\ 3x &= 6 \\ x &= 2 \end{aligned}$$

The ordered pair is (2, 1). Remember, the *x-value* is always written *first* in the ordered pair.

Suppose we choose 3 for y . Then we get

$$\begin{aligned} 3x - 4 \cdot 3 &= 2 \\ 3x - 12 &= 2 \\ 3x &= 14 \\ x &= 1\frac{2}{3} \text{ or } 1\frac{2}{3} \end{aligned}$$

The ordered pair is ($1\frac{2}{3}$, 3).

The table of ordered pairs below was obtained by this method.

$x =$	$-3\frac{1}{3}$	$-2\frac{2}{3}$	$\frac{2}{3}$	2	$4\frac{2}{3}$	6
then $y =$	-3	-1	0	1	3	4

The graph (upper right column) is obtained by finding the point corresponding to each ordered pair in the table. After the points are plotted on the grid, a straight line is drawn through them.

Since two points of a line are enough to determine its position, you do not have to use as many number pairs as we did to sketch the graph. The two easiest points to obtain are those corresponding to the number pair in which x is 0 and to the number pair in which y is 0.

Consider the linear equation

$$y - 2x = -4$$

When x is 0, it is clear the term containing x is blotted out; then y is -4 . The number pair is (0, -4). The -4 is the *y-intercept* of the graph. It is the distance from 0 to the point where the graph crosses the *y-axis*.

When y is 0 in the above equation, blot out the term containing y . Then

$$\begin{aligned} -2x &= -4 \\ x &= 2 \end{aligned}$$

The number pair is (2, 0). The 2 is the *x-intercept* of the graph. It is the distance from 0 to the point where the graph crosses the *x-axis*.

These number pairs appear in the table of values that accompanies the graph below.

Notice that the **y-intercept** is negative, because the graph crosses the **y-axis** below 0. On the other hand, the **x-intercept** is positive, because the graph crosses the **x-axis** to the right of 0. When you use the two number pairs, one in which $x = 0$ and the other in which $y = 0$, to determine the graph, we say you are *graphing by intercepts*.

We have two examples of straight line graphs now, first the graph of $3x - 4y = 2$ and second the graph of $y - 2x = -4$. As you look at these two examples, observe that (a) the second graph is steeper than the first graph and (b) as your eye follows along the graphs from left to right they slant upward. If the graphs were outlines of hills, you would say the second hill had a steeper slope, or a greater slope, than the first. We use the same word, *slope*, in mathematics to describe the steepness of a graph. But in mathematics we go further; we try to get a numerical measure of this slope so that we can compare, by numbers, the slopes of two graphs.

Draw any straight line graph on a grid.

You notice there are no abrupt changes in the slant of the graph; in fact, the slant or the steepness or the slope is everywhere the same. This observation furnishes the key to a definition of slope. Choose any two points on the straight line. At the points draw one dashed line parallel to the **y-axis** and another dashed line parallel to the **x-axis** so that the two dashed lines intersect or cross

one another. Then, slope is defined as follows:

$$\text{slope} = \frac{\text{rise}}{\text{run}}$$

We can get a numerical measure of the slope for our example by counting the number of squares in the run and the number of squares in the rise. The run = 6 squares; the rise = 10 squares. Thus,

$$\text{slope} = \frac{10}{6} \quad \text{or} \quad \frac{5}{3}$$

For the second pair of points, run = 5 and rise = 9 squares; therefore

$$\text{slope} = \frac{9}{5} \quad \text{or} \quad 9 \cdot \frac{5}{27} = \frac{5}{3}$$

Notice that the two slopes are $\frac{5}{3}$, just as we expected.

If the line we had drawn slanted downward as our eye moved from left to right instead of slanting upward as in the example, then we would have said the line has *negative slope*. In the example, the line has *positive slope*, because it slants upward as the eye moves from left to right. Historically, for reasons that are not clear, slope always denoted by the letter **m**. So we write

$$m = \frac{\text{rise}}{\text{run}}$$

and understand that **m** always represents the slope.

Let us apply the idea of slope to an equation,

$$y = 3x - 5$$

To make a graph, we first need a table of values. When $x = 0$, we have $y = -5$. The one ordered pair is $(0, -5)$. Another pair of numbers is obtained by replacing x by

$$\begin{aligned} y &= 3 \cdot 2 - 5 \\ y &= 6 - 5 \\ y &= 1 \end{aligned}$$

The ordered pair is $(2, 1)$. The graph appears on page 147, left column.

Earlier (page 143) we said that a graph was a visual aid. We used the graph in this way to find a way to define slope so that we could describe the steepness of a line precisely, by means of a number. We shall use the graph in this way again. The graph furnishes a picture of the relationship expressed by the equation. All further relationships are contained in the equation, but so abstractly that we need the picture, the

graph, to tell us what to look for.

We are studying the equation,

$$y = 3x - 5$$

and its graph. First, let us find the slope of the line. Slope is rise over run between *any* two points on the graph. Hence, we are not prohibited from choosing the points *conveniently*. We pick two points so that we get an exact number of squares for both the run and the rise. Then, on the graph,

$$\text{slope} = \frac{\text{rise}}{\text{run}} = \frac{6}{2} = 3$$

Now, the number that multiplies x in the equation is 3, too. There is a relationship between this number and the slope:

Whenever a linear equation is in the form y equals something, the number that multiplies x is the slope.

We notice from the graph that the **y-intercept** is -5 . In the equation, the number that stands all by itself is -5 . Again, an observation can be made:

Whenever a linear equation is in the form y equals something, the number that stands by itself equals the **y-intercept**.

But, suppose our linear equation is like

$$3x - 2y = 7$$

What can we do to find the **slope** and the **y-intercept**? We can try to rework the equation so that y is all by itself on one side of the equal sign. First, we subtract $3x$ from both members,

$$-2y = 7 - 3x$$

or, interchanging the two terms in the right member,

$$-2y = -3x + 7$$

Then, we divide both members of the equation by -2 , remembering to apply our rule of signs for dividing directed numbers,

$$\frac{-2y}{-2} = \frac{-3x}{-2} + \frac{7}{-2}$$

$$y = \frac{3x}{2} - \frac{7}{2}$$

So, the equation is in the form y equals something. Thus, we know

$$\text{slope} = m = \frac{3}{2}$$

and

$$y\text{-intercept} = -\frac{7}{2}$$

Why are we anxious to obtain the **slope** and the **y-intercept**? Because the information furnishes us with a quick way to sketch the graph of the linear equation. The **y-intercept** gives us one ordered pair immediately; it is $(0, -\frac{7}{2})$, since x is 0 on the y -axis.

The slope is $\frac{3}{2}$. It is positive; so the line slants upward to the right. We can take the run to be 2 units to the right from $(0, -\frac{7}{2})$, and the corresponding rise 3 units up. Thus, we arrive at another point on the graph; its corresponding ordered pair of numbers is $(2, -\frac{1}{2})$. A straight line drawn through the two points completes the graph.

Systems of Equations

Graphs can be used to find the solutions of a system of two equations in two unknowns, provided a solution exists. Whenever we have two linear equations, like

$$\begin{aligned} 3x + 4y &= 12 \\ 2x - y &= 8 \end{aligned}$$

for which we wish to find the number pair (x, y) that is a solution of both equations, we say we have a system of two equations in two unknowns to solve.

Such a system could arise in solving a problem like the following:

The sum of two numbers is 8, but the larger number is 3 times the smaller. Find the two numbers.

First, translate the problem stated in words into mathematical symbols.

Let x denote the smaller number.
Let y denote the larger number.

Then, "the sum of two numbers is 8" becomes " $x + y = 8$."

"The larger number is 3 times the smaller" becomes " $y = 3x$."

The system of two equations in two unknowns for our problem is:

$$\begin{aligned} x + y &= 8 \\ y &= 3x \end{aligned}$$

The next step is to draw the graphs of the equations on the same grid. To do so, we need a table of values for each equation. Let us use the intercept method.

In the first equation, $x + y = 8$, replace x by 0; then $y = 8$. The ordered pair is $(0, 8)$. Now, replace y by 0; then $x = 8$. The ordered pair is $(8, 0)$.

When x is replaced by 0 in the second equation, $y = 3x$, it turns out that y is 0 also, giving the ordered pair $(0, 0)$. We must modify our procedure for graphing by intercepts, for we need two different points to determine the graph of the equation. Let us replace x by 1; then $y = 3$. The ordered pair is $(1, 3)$.

The graphs, with the accompanying tables appear opposite.

All the pairs of values of x and y that satisfy $x + y = 8$ lie on its straight line graph.

All the pairs of values of x and y that satisfy $y = 3x$, lie on its straight line graph.

Therefore, the pair of values of x and y that satisfy both equations must belong to

the point of intersection of the two straight lines.

From the graph, we read the numbers corresponding to this point. The numbers are: 2 for x and 6 for y . Hence, the smaller number is 2; the larger number is 6.

Clearly, their sum is 8, and the larger is 3 times the smaller, checking with the conditions laid down in the statement of the problem. Since two straight lines intersect in one and only one point, we can be sure that there is just one number pair that is a solution for the system of equations.

If the two graphs had crossed at a point whose corresponding number pair involve fractions, reading these fractions correctly from the graph would be almost impossible. We must look for a way to solve a system of equations, then, that does not depend upon graphs. We look for analytic methods.

These methods have the effect of transforming the set of two equations with two unknowns into one equation with one unknown—and we know how to handle the latter.

One analytic method used is the method of substitution. Consider the system:

$$\begin{aligned} x + y &= 8 \\ x - y &= 4 \end{aligned}$$

If we could express one of the unknowns, say x , in terms of y and numbers, then we could use this expression as a substitute for x .

Regard the second equation of the system. Clearly, by adding y to both members we obtain

$$x = 4 + y$$

Now, substitute $4 + y$ for x in the first equation of the system:

$$(4 + y) + y = 8$$

All we need to do now is to solve the above equation for the value of y . We have succeeded in transforming our system of two equations with two unknowns into a single equation with one unknown.

We proceed to solve for y by removing parentheses:

$$\begin{array}{rcl} 4 + y + y & = & 8 \\ 4 + 2y & = & 8 \\ 4 & = & 4 \\ \hline 2y & = & 4 \\ \frac{2y}{2} & = & \frac{4}{2} \\ y & = & 2 \end{array}$$

To find the value of x corresponding to the above value of y replace y by 2 in either of the original equations. That is, if you take $x + y = 8$, you get

$$\begin{array}{rcl} x + 2 & = & 8 \\ 2 & = & 2 \\ \hline x & = & 6 \end{array}$$

The solution for the system of equations is the number pair (6, 2). That this number pair is indeed the solution is verified by putting 6 for x and 2 for y in each of the original equations.

Another procedure for solving a system of two equations with two unknowns is called *addition or subtraction*. As an example, to illustrate the method, consider the system:

$$\begin{array}{rcl} 2x - 5y & = & 18 \\ 3x + 2y & = & 8 \end{array}$$

Just as in the case of the substitution method, the plan is to transform the system of two equations with two unknowns into a single equation with one unknown. However, instead of expressing one unknown in terms of the other and substituting, we shall eliminate one of the unknowns between the

two equations by adding them or subtracting them.

Look at the two equations in the example. We can eliminate y between them by addition, but to do so the numbers multiplying y must be the same. Since it is permissible to multiply an equation by a non-zero number, we can make the multipliers of y in both equations the same if we multiply the first equation by 2 and the second by 5.

The work follows:

$$\begin{array}{rcl} 2(2x) - 2(5y) & = & 2(18) \\ 5(3x) + 5(2y) & = & 5(8) \\ \hline 4x - 10y & = & 36 \\ 15x + 10y & = & 40 \\ \hline 19x & = & 76 \\ \frac{19x}{19} & = & \frac{76}{19} \\ x & = & 4 \end{array}$$

To find the value of y , replace x by 4 in either one of the given equations; say the second:

$$\begin{array}{rcl} 3x + 2y & = & 8 \\ 3(4) + 2y & = & 8 \\ 12 + 2y & = & 8 \\ 12 & = & 8 - 2y \\ \hline 2y & = & -4 \\ \frac{2y}{2} & = & \frac{-4}{2} \\ y & = & -2 \end{array}$$

Hence, the number pair (4, -2) seems to be the solution. That it is the solution can be seen if you replace x by 4 and y by -2 in the left member of both of the given equations:

$$\begin{array}{rcl} 2(4) - 5(-2) & = & 8 + 10 \\ 3(4) + 2(-2) & = & 12 - 4 \end{array}$$

Since

$$\begin{array}{rcl} 8 + 10 & = & 18 \\ 12 - 4 & = & 8 \end{array}$$

and since 18 and 8 are the respective right members in the given equations, you can see that true statements result.

Quadratic Equations

The graphs of the equations we have examined so far have been straight lines. Some equations have curves for their graphs. For example, an equation like

$$y = x^2 - 2x - 8$$

has a curve, called a *parabola*, for its graph. This is a *quadratic equation*. It is called a quadratic equation because it contains an x^2 -term. The x^2 -term is of the second degree, since its exponent is 2.

To draw the graph of the quadratic equation, we need a table of ordered pairs, just as we did in the case of a linear equation. Since x may be replaced by any number, let us choose a convenient list, beginning with -3 . If -3 is put in place of x in the equation, we have

$$y = (-3)^2 - 2(-3) - 8$$

Remembering our rules for multiplying directed numbers, we obtain,

$$\begin{aligned} y &= 9 + 6 - 8 \\ y &= 7 \end{aligned}$$

Thus, one ordered pair whose corresponding point lies on the graph is $(-3, 7)$.

If x is replaced by 2 , for example, we have

$$\begin{aligned} y &= (2)^2 - 2(2) - 8 \\ y &= 4 - 4 - 8 \\ y &= -8 \end{aligned}$$

Another ordered pair, therefore, whose corresponding point lies on the graph is $(2, -8)$.

The table that we obtain by proceeding in the above way, along with the graph on the opposite table, is shown below.

Table for $y = x^2 - 2x - 8$

x	-3	-2	-1	0	1	2	3	4	5
y	7	0	-5	-8	-9	-8	-5	0	7

Observe that the graph crosses the x -axis in two points, instead of one point as in the case of a straight line graph. The number pairs corresponding to the two points are

$$(-2, 0) \text{ and } (4, 0)$$

It is appropriate to call these points the *zeros* of the quadratic equation, for y is 0 at each. Are the numbers -2 and 4 roots of

$$x^2 - 2x - 8 = 0?$$

The above equation is obtained from our given equation by replacing y by 0 .

Let us see if -2 is a root. Replace x by -2 in the equation:

$$(-2)^2 - 2(-2) - 8 = 4 + 4 - 8 = 0$$

Yes, -2 is a root, since a true statement is obtained. Let us see if 4 is a root. Replace x by 4 in the equation:

$$(4)^2 - 2(4) - 8 = 16 - 8 - 8 = 0$$

Yes, 4 is a root. That is, a quadratic equation has two solutions. The solutions of

$$x^2 - 2x - 8 = 0$$

are -2 and 4 , as we have just seen. A linear equation, like

$$x - 3 = 7$$

has only one solution, in this case, 10 .

To summarize, a linear equation has one solution, a quadratic equation has two solutions. How many solutions do you think a cubic equation, like

$$x^3 - 4x^2 - 5x - 8 = 0$$

would have? It has three, but the methods for solving such an equation are beyond the scope of elementary algebra.

We verified by an example that a quadratic equation has two solutions. We assume in general, a quadratic equation

$$ax^2 + bx + c = 0$$

(where a is not zero; a , b , and c are numbers; and x is an unknown) has two solutions.

It is not necessary to use a graph to find the solutions of a quadratic equation. There are analytic methods that can be used.

Solution by factoring.

Another way to solve the quadratic equation,

$$x^2 - 2x - 8 = 0$$

is to observe that the left member is a trinomial type of factoring. If we factor the left member, we have

$$(x + 2)(x - 4) = 0.$$

Now, if the product of two numbers, or factors, is zero, at least one of the factors must be zero. In our case, this means

$$x + 2 = 0 \quad \text{or} \quad x - 4 = 0$$

The value of x that makes $x + 2 = 0$ is -2 .

The value of x that makes $x - 4 = 0$ is 4 .

To see that these values satisfy our equation, we use each in turn as a replacement for x .

First, consider -2 ; in

$$(x + 2)(x - 4)$$

replace x by -2 :

$$(-2 + 2)(-2 - 4) = (0)(-6) = 0,$$

since 0 times any number is 0 .

Second, consider 4 ; in

$$(x + 2)(x - 4)$$

replace x by 4 :

$$(4 + 2)(4 - 4) = (6)(0) = 0,$$

since any number times 0 is 0 .

Thus, the solutions of our quadratic equation are 4 and -2 .

Let us do another example. Find the solutions of

$$3x^2 - x = 4$$

In order to apply the method of solution by factoring, we must have a product of factors equal to zero. But we do not have one member zero in our equation. That does not need to stop us, though, because we can get zero in the right member if 4 is subtracted from both members of the equation. The result is

$$3x^2 - x - 4 = 0$$

Again, we recognize the left member as a trinomial type of factoring. So, we have

$$(3x - 4)(x + 1) = 0$$

Recall if a product of factors is zero at least one of the factors must be zero. Hence, we have

$$3x - 4 = 0 \quad \text{or} \quad x + 1 = 0$$

The value of x that makes $3x - 4 = 0$ is $\frac{4}{3}$.

The value of x that makes $x + 1 = 0$ is -1 .

To see that each of these values is a solution of our equation, replace x by each of the numbers.

First, replace x by $\frac{4}{3}$ in

$$(3x - 4)(x + 1)$$

then

$$\begin{aligned} \left[3\left(\frac{4}{3}\right) - 4 \right] \left[\frac{4}{3} + 1 \right] &= \left[4 - 4 \right] \left[\frac{7}{3} \right] \\ &= \left[0 \right] \left[\frac{7}{3} \right] \\ &= 0 \end{aligned}$$

Second, replace x by -1 in

$$(3x - 4)(x + 1)$$

then

$$\begin{aligned} [3(-1) - 4] [-1 + 1] &= [-3 - 4][0] \\ &= 0 \end{aligned}$$

Since the value of the left member equals the value of the right member in each case, it is indeed the case that $\frac{4}{3}$ and -1 are solutions of the given quadratic equation.

Solution by formula.

Not all quadratic equations can be solved by factoring because some do not have the form of a type of factoring taught in high school algebra. For instance,

$$2x^2 + 5x + 1 = 0$$

cannot be solved by factoring, because the left member does not have a monomial factor or a binomial factor of the type a high school algebra student knows.

When a situation like this arises, we use a formula to find the solutions. The formula,

giving the values of x , the unknown in the quadratic equation, is

$$x = \frac{-b \pm \sqrt{b^2 - 4ac}}{2a}$$

where the a , b , and c of the formula are the same as those shown in the quadratic equation,

$$ax^2 + bx + c = 0$$

Notice, the formula gives two solutions. One goes with the "+" sign and is

$$x = \frac{-b + \sqrt{b^2 - 4ac}}{2a}$$

The other goes with the "-" sign and is

$$x = \frac{-b - \sqrt{b^2 - 4ac}}{2a}$$

We are ready to solve by the formula our example:

$$2x^2 + 5x + 1 = 0$$

By comparing this equation with the general form of a quadratic equation,

$$ax^2 + bx + c = 0$$

we see that

$$a = 2, b = 5, c = 1$$

Now, put these numbers in place of their corresponding letters in the formula:

$$x = \frac{-b \pm \sqrt{b^2 - 4ac}}{2a}$$

$$x = \frac{-5 \pm \sqrt{5^2 - 4 \cdot 2 \cdot 1}}{2 \cdot 2}$$

$$x = \frac{-5 \pm \sqrt{25 - 8}}{4}$$

$$x = \frac{-5 \pm \sqrt{17}}{4}$$

We can find $\sqrt{17}$ by arithmetic or from a table of square roots. In a table, we will find

$$\sqrt{17} = 4.123$$

Now, we can find the values of x :

$$x = \frac{-5 \pm 4.123}{4}$$

That is,

$$x = \frac{-5 + 4.123}{4} \quad \text{or} \quad x = \frac{-5 - 4.123}{4}$$

$$x = \frac{-0.877}{4} \quad \text{or} \quad x = \frac{-9.123}{4}$$

$$x = -0.219 \quad \text{or} \quad x = -2.281$$

The solutions of our example, then, are -0.219 and -2.281 .

As a second example of use of the formula, we shall find the solutions of the quadratic equation

$$5x^2 + 6x - 8 = 0$$

First, we must put the equation in a form so that one member is zero. Subtract 8 from both members:

$$5x^2 + 6x - 8 = 0$$

Second, write what a , b , and c equal:

$$a = 5, b = 6, c = -8$$

Third, write the formula and replace a , b , and c in the formula by their values:

$$x = \frac{-b \pm \sqrt{b^2 - 4ac}}{2a}$$

$$x = \frac{-6 \pm \sqrt{6^2 - (4)(5)(-8)}}{2 \cdot 5}$$

$$x = \frac{-6 \pm \sqrt{36 + 160}}{10}$$

$$x = \frac{-6 \pm \sqrt{196}}{10}$$

But $\sqrt{196} = 14$; putting 14 for $\sqrt{196}$ in the above equality, we get

$$x = \frac{-6 + 14}{10} \quad \text{or} \quad x = \frac{-6 - 14}{10}$$

$$x = \frac{8}{10} = \frac{4}{5} \quad \text{or} \quad x = \frac{-20}{10} = -2$$

So the solutions of the example are $\frac{4}{5}$ and -2 .

Up to this point your algebra student has

worked with at most squares and square roots. Can the work be extended to larger powers and roots different from squares? The answer is yes. Since the answer is yes,

we can make a "breakthrough" and study another topic in mathematics, a topic that has an interesting theory as well as interesting applications.

Exponents and Radicals

From earlier work in mathematics we know that

$$\begin{aligned}x^1 &= x \\x^2 &= x \cdot x\end{aligned}$$

and it seems reasonable to suppose that we can go on:

$$\begin{aligned}x^3 &= x \cdot x \cdot x \\x^4 &= x \cdot x \cdot x \cdot x\end{aligned}$$

as far as we like—so long as x is not zero and so long as the exponent is a positive whole number. But what about negative whole numbers? Can they be used as exponents? Can 0 be used as an exponent? Is it all right to use a fraction as an exponent? It is answers to these questions that we seek.

First, let us agree on the following words to describe what we shall be working with:

Then, 4 is the *exponent* of the power; x is the *base*; and the whole thing, x^4 , is described as the **fourth power of x** or a **fourth power**.

We already know that for a non-zero base x ,

$$x^n = \underbrace{x \cdot x \cdot x \cdot \dots \cdot x}_{n \text{ factors}}$$

where n is a positive whole number. That is, we know

$$x^6 = \underbrace{x \cdot x \cdot x \cdot x \cdot x \cdot x}_{6 \text{ factors}}$$

Now let us try to find the product of two powers of the same base. We should like to find

$$2^3 \cdot 2^4$$

$$2^3 = 2 \cdot 2 \cdot 2$$

and

$$2^4 = 2 \cdot 2 \cdot 2 \cdot 2$$

so

$$\begin{aligned}2^3 \cdot 2^4 &= (2 \cdot 2 \cdot 2)(2 \cdot 2 \cdot 2 \cdot 2) \\2^3 \cdot 2^4 &= 2^{3+4} = 2^7\end{aligned}$$

Consider another example:

$$\begin{aligned}y^5 \cdot y^4 &= (y \cdot y \cdot y \cdot y \cdot y)(y \cdot y \cdot y \cdot y) \\&= y^{5+4} = y^9\end{aligned}$$

These examples lead us to assert that the product of two powers of the same base is obtained by adding their exponents. In symbols, we write

$$x^m \cdot x^n = x^{m+n}$$

where x is not zero and m and n are positive whole numbers.

Just suppose the above law applied when $n = 0$.

Then we would have,

$$x^m \cdot x^0 = x^{m+0} = x^m$$

that is, we have

$$x^m \cdot x^0 = x^m$$

Think back to numbers. What special number, taken as a multiplier, leaves the product unchanged? This is characteristic of 1, for

$$x^m \cdot 1 = x^m$$

It looks as if we must conclude that

$$x^0 = 1$$

if powers are going to behave according to the rules for operating with numbers that we already know.

Thus, we are led to *define* a zero power as one. The zeroth power of any non-zero number is 1. For example, we write

$$\begin{aligned}y^0 &= 1 \\3^0 &= 1 \\(1,000,987)^0 &= 1 \\(1958)^0 &= 1\end{aligned}$$

We have found a way to express the product of two powers of the same base. Can a rule be developed for the quotient of two powers of the same base? And, if so, what is the rule?

Let us consider a few examples:

$$\frac{x^8}{x^2} = \frac{\cancel{x} \cdot \cancel{x} \cdot \cancel{x} \cdot \cancel{x} \cdot \cancel{x} \cdot \cancel{x} \cdot \cancel{x} \cdot x}{\cancel{x} \cdot \cancel{x}} = x \cdot x \cdot x \cdot x \cdot x \cdot x$$

$$= x^{8-2} = x^6$$

$$\frac{x^7}{x^3} = \frac{\cancel{x} \cdot \cancel{x} \cdot \cancel{x} \cdot \cancel{x} \cdot \cancel{x} \cdot x \cdot x}{\cancel{x} \cdot \cancel{x} \cdot \cancel{x}} = x^{7-3} = x^4$$

$$\frac{y^2}{y^5} = \frac{y \cdot y}{y \cdot y \cdot y \cdot y \cdot y} = \frac{1}{y \cdot y \cdot y}$$

$$= \frac{1}{y^{5-2}} = \frac{1}{y^3}$$

We need two rules because we have two different kinds of answers. First,

$$x^m \div x^n = x^{m-n}$$

if x is not zero, m and n are positive whole numbers, and m is greater than n . Second,

$$x^m \div x^n = \frac{1}{x^{n-m}}$$

if x is not zero, m and n are positive whole numbers, and m is less than n (or n is greater than m).

Applications of the two rules are:

$$x^9 \div x^4 = x^{9-4} = x^5$$

$$w^4 \div w^7 = 1/w^{7-4} = 1/w^3$$

$$3^8 \div 3^5 = 3^{8-5} = 3^3$$

Does our definition of a zero power "fit in" with the rules we have just developed for quotients? Yes,

$$x^4 \div x^4 = x^{4-4} = x^0 = 1$$

and

$$\frac{x^4}{x^4} = 1$$

since a number divided by itself is 1. Just to be sure, let us look at another example:

$$(-2)^3 \div (-2)^3 = (-2)^{3-3} = (-2)^0$$

but

$$\frac{(-2)^3}{(-2)^3} = \frac{-8}{-8} = 1$$

so, we have

$$(-2)^3 \div (-2)^3 = (-2)^0 = 1$$

One of our examples above was

$$\frac{y^2}{y^5} = \frac{1}{y^{5-2}} = \frac{1}{y^3}$$

Now, suppose we forgot our second rule, or failed to observe that the exponent in the denominator was greater than the exponent in the numerator, and simply applied the first rule for quotients. Then, we should have

$$\frac{y^2}{y^5} = y^{2-5} = y^{-3}$$

Look at the two results:

$$\frac{1}{y^3} \text{ and } y^{-3}$$

In mathematics, we hate to have different answers for the same problem. We do not want to have $y^2 \div y^5$ sometimes to be y^{-3} and sometimes to be $1/y^3$. The way out of the difficulty is to say, *by definition*, the two shall be the same. That is,

$$y^{-3} = \frac{1}{y^3}$$

The same definition applies to any non-zero base:

$$x^{-n} = \frac{1}{x^n}$$

where n can be any directed number.

There remains the problem of fractional exponents. What meaning should be given to a power with a fractional exponent, like

$$x^{1/2}$$

The fractional exponent ought to have meaning such that

$$x^{1/2} \cdot x^{1/2} = x^{1/2+1/2} = x$$

On the other hand, from the work with square roots, we know that

$$\sqrt{x} \cdot \sqrt{x} = \sqrt{x^2} = x$$

These examples suggest that

$$x^{1/2} = \sqrt{x}$$

With the above meaning for a fractional exponent it can be shown that all the laws for exponents already developed apply also to fractional exponents. For example,

$$x^{1/2} \div x^{1/3} = x^{1/2-1/3} = x^{1/6}$$

$$x^{1/4} \cdot x^{1/2} = x^{3/4}$$

$$x^{1/8} \div x^{1/8} = x^{1/8-1/8} = x^0 = 1$$

In general, the definition of a fractional exponent is

$$x^{m/n} = \sqrt[n]{x^m}$$

Examples follow:

$$w^{2/3} = \sqrt[3]{w^2}$$

$$4^{3/2} = \sqrt{4^3} = \sqrt{64} = 8$$

Notice that the denominator of the fractional exponent indicates the root, and the numerator indicates the power.

The pay-off for the work on exponents and radicals appears for an algebra student in his work with *logarithms*. It is to them that we next turn.

Logarithms

A logarithm is an exponent. Thus, the work with exponents of powers and the work with logarithms are not totally unrelated. The same laws that have been developed for operations with powers carry over to operations with logarithms.

A logarithm is a new notation for an exponent of a power. The logarithm relates the base of the power to the exponent in a new way. Consider a power, and its value,

$$2^4 = 16$$

here 2^4 is the power; its value, or what we call the number, is 16; the base is 2; and the exponent is 4.

Now, when the above example is written in the notation of logarithms, we should expect the logarithm to equal the exponent, 4. The sentence stating the example in logarithmic form is:

logarithm of 16 to the base 2 equals 4

and the notation for the sentence is,

$$\log_2 16 = 4$$

There follow additional examples:

Exponential form:

$$2^3 = 8$$

Logarithmic form:

logarithm of 8 to the base 2 equals 3

$$\log_2 8 = 3$$

Exponential form:

$$10^2 = 100$$

Logarithmic form:

logarithm of 100 to the base 10 equals 2

$$\log_{10} 100 = 2$$

Other examples are arranged below in parallel columns.

Exponential Form

Logarithmic Form

$$9^{3/2} = 27$$

$$\log_9 27 = \frac{3}{2}$$

$$5^{-2} = \frac{1}{25}$$

$$\log_5 \frac{1}{25} = -2$$

$$6x = N$$

$$\log_6 N = x$$

$$10^{-2} = \frac{1}{100} = 0.01$$

$$\log_{10} 0.01 = -2$$

Logarithms were invented in order to simplify computations. They reduce multiplication to addition and division to subtraction. Let us see how this is done. But first we need a table of logarithms. The table is constructed in terms of a base: the adjoining table was made with a choice of base 3. The table was constructed from the connection between logarithms and exponents:

$\log_3 1 = 0$ since $3^0 = 1$	2,187	7
$\log_3 3 = 1$ since $3^1 = 3$	6,561	8
$\log_3 9 = 2$ since $3^2 = 9$	19,683	9
and so on.	59,049	10

and so on.

Now, suppose you wish to find the product:

$$N = 2187 \times 27$$

The numbers can be written as powers of 3 and their exponents added.

$$3^7 \times 3^3 = 3^{7+3} = 3^{10}$$

But another way to do the multiplication is to use the new logarithmic notation:

$$\begin{array}{rcl} \log_3 2187 & = & 7 \\ (+) \log_3 27 & = & 3 \\ \hline \log_3 N & = & 10 \\ N & = & 59,049 \end{array}$$

where the value of N is obtained from the table by looking in the "log N " column for 10 and reading its corresponding number. Of course, the logarithms are added since exponents are added in a product.

Consider the following example: Find

$$N = 19,683 \div 243$$

The numbers can be written as powers of 3 and their exponents subtracted:

$$\frac{3^9}{3^5} = 3^{9-5} = 3^4 = 81$$

But, we can also do the example by logarithms, subtracting the logarithms of the numbers, since the logarithms are the exponents:

$$\begin{array}{rcl} \log_3 19,683 & = & 9 \\ (-) \log_3 243 & = & 5 \\ \hline \log_3 N & = & 4 \\ N & = & 81 \end{array}$$

The foregoing procedure for introducing logarithms is followed by many textbooks. By the time an algebra student has worked through a few exercises, he begins to wonder. What would happen if the numbers chosen did not appear in the table?

Suppose you wanted to find

$$13 \times 782$$

What would you do? One answer is that you might extend the table; for example,

$\log_3 13$ would lie between 2 and 3

since

$$\log_3 9 = 2 \text{ and } \log_3 27 = 3$$

However, it turns out to be much simpler if you change to another base before beginning to consider an extended table. That base is 10; it is chosen because it is also the base of our decimal number system.

Any number can be expressed in the decimal number system as a multiple of a power of 10. For example,

$$\begin{array}{ll} 6.78 = 6.78 \times 10^0 & 0.678 = 6.78 \times 10^{-1} \\ 67.8 = 6.78 \times 10^1 & 0.0678 = 6.78 \times 10^{-2} \\ 678 = 6.78 \times 10^2 & 0.00678 = 6.78 \times 10^{-3} \\ 6780 = 6.78 \times 10^3 & 0.000678 = 6.78 \times 10^{-4} \end{array}$$

Notice in the examples that each numeral contains the same sequence of digits.

Each numeral is written as 6.78 times a power of 10. Now, we know that

$$\begin{aligned} \log 678 &= \log (6.78 \times 10^2) \\ &= \log 6.78 + \log 10^2 \\ &= \log 6.78 + 2 \end{aligned}$$

since

$$\log 10^2 = \log 100 = 2$$

when the base of the logarithm is 10 (custom dictates that the base is not written when it is 10).

Since all three-place numerals involve only the ten digits (0, 1, 2, 3, 4, 5, 6, 7, 8, 9) of our number system, all that mathematicians had to do was construct tables for logarithms of numbers with sequences of digits between 1 and 999.

Notice that in our example,

$$\log 678 = 2 + \log 6.78$$

the logarithm consists of a whole number 2, and $\log 6.78$. Now, $\log 6.78$ is a positive decimal fraction. For, 6.78 lies between 1 and 10:

$$1 < 6.78 < 10$$

But $\log 1 = 0$ and $\log 10 = 1$; so

$$(0 = \log 1) < \log 6.78 < (\log 10 = 1)$$

Each logarithm to the base 10 can be written as a whole number plus a positive decimal fraction. Names are given to these two parts of a logarithm to the base 10:

Characteristic = whole number part (it is positive, negative, or zero)

Mantissa = positive decimal fraction part.

where $\log 3.856$ was found in a table of mantissas.

Example 2. Find $\log 0.00789$

First, express the number as the product of two numbers, one a power of 10:

$$0.00789 = 7.89 \times 10^{-3}$$

Second, find the logarithm:

$$\begin{aligned}\log 0.00789 &= \log (7.89 \times 10^{-3}) \\ &= \log 7.89 + \log 10^{-3} \\ &= \log 7.89 - 3 \\ &= 0.8971 - 3\end{aligned}$$

since $\log 10^{-3} = -3$ and in a table of mantissas we found $\log 7.89 = 0.8971$.

Example 1. Find $\log 385.6$

First, express the number as the product of two numbers, one a power of 10:

$$385.6 = 3.856 \times 10^2$$

Then, find the logarithm:

$$\begin{aligned}\log 385.6 &= \log (3.856 \times 10^2) \\ &= \log 3.856 + \log 10^2 \\ &= \log 3.856 + 2 \\ &= 0.5862 + 2 \\ &= 2.5862\end{aligned}$$

Summary

There are many topics in high school mathematics that have been only mentioned here. But those are topics that are presented clearly in textbooks. If your son or daughter has trouble with such a topic—like series or trigonometry—go over his textbook explanation with him.

Sometimes an upper division student is helped most if he has a chance to talk over his problem with someone. The act of putting into words the difficulty clarifies it. Then you, as parent, will not be called upon to explain the mathematics!

With the introductory material and the first ideas behind him, your son or daughter builds a mathematical structure by adding definitions, leading to more operations. There is no end to what can be done, because mathematics represents a rapidly growing and expanding body of knowledge. So far as high school mathematics is con-

cerned, you as a parent are most effective if you can help your teen-ager to get a good start. Helping him over the first hurdles, teaching him correct ideas as reviewed here, and putting him on his own thereafter is good advice to follow. Remember that information concerning mathematics can be obtained, also, from your child's textbook. Help him to learn to help himself through careful reading and asking questions.

Of course, you may be interested in mathematics as a hobby or because of a need in your work. Then, for you there exist today many excellent books on mathematics. Some are intended to inform the general public concerning the advances in mathematics. Others are written for people who find a knowledge of mathematics necessary for advancement in their fields. You have a large number of publications from which to make your choices.

For any reader that does not have a copy of the 1957 edition of the *INFORMATION PLEASE ALMANAC*, which included the first part of *Relearning Mathematics*, we have made arrangements to supply a reprint of it—consisting of 24 pages.

You can obtain a copy by sending your order with 25¢ to *INFORMATION PLEASE ALMANAC*, 444 Madison Avenue, New York 22, New York.

Since only a limited number of copies are available, we urge you to send your order in promptly.

If our supply is exhausted when we receive your order, we reserve the right to return your money without furnishing you the reprint copy of *Relearning Mathematics, Part I*.

Apple-Cheese Pie

About 7 cups	¾ teaspoon nut-
pared, sliced	meg
cooking apples	1 pkg. pie crust
(3 to 4 lbs.)	mix
½ cup granulated	½ lb. packaged
sugar	process cheese
½ cup brown	food or spread,
sugar, packed	sliced
3 tablespoons	2 tablespoons
flour	butter or mar-
¾ teaspoon cin-	garine
namon	

In large bowl toss together apples, sugar, brown sugar, flour, cinnamon and nutmeg. Start heating oven to 425° F. Make up pie crust mix as label directs. On lightly floured surface, roll out half of pastry into 12" circle. Place in 9" pie plate. Fill with half of apple mixture, top with cheese, then add the rest of apples. Dot with shortening. Roll out rest of pastry into 14" circle and place over apples. Cut slits in pastry. Fold edges of top crust under bottom crust. Press to seal, and flute edge. Bake pie 40 minutes or until done. Serve warm.

Tomato Foogath

3 tablespoons	very thinly
butter or mar-	sliced
garine	¾ teaspoon
1 medium onion,	ginger
thinly sliced	4 large tomatoes,
1 pickled hot	skinned and
pepper, very	diced
thinly sliced	2 tablespoons
(optional)	grated coconut
2 cloves garlic,	1½ teaspoons salt

Put shortening in skillet and sauté the

onion, pepper, garlic and ginger until vegetables are tender. Stir in tomatoes, coconut and salt, and simmer, uncovered, stirring occasionally until liquid is nearly evaporated, 10 to 15 minutes. Serve as side dish with meats, curry, eggs, etc.

Serves 6.

Italian Fish Soup

3 tablespoons	2 diced, pared
salad oil	medium pota-
⅓ cup chopped	atoes
celery (about	2 tablespoons
1 big stalk)	minced parsley
⅓ cup minced	2½ teaspoons salt
onion (about	¼ teaspoon pep-
1 medium)	per
¼ cup minced	1 lb. flaked,
green pepper	cooked fish
(about ¼ of a	(any white
medium one)	fish)
1 No. 2½ can	1 cup cleaned,
(3½ cups) to-	cooked or can-
matoes (Ital-	ned shrimp (
ian style pre-	5-oz. can)
ferred)	¼ cup dry white
3 cups water (or	wine
fish or vege-	Grated Parme-
table stock)	san cheese
	Croutons

Sauté in oil until just tender, celery, onion and green pepper, then add tomatoes, water, potatoes, parsley and seasoning. Bring mixture to boil, then reduce heat so that it just simmers. After about a half hour, add fish and shrimp and simmer about 10 minutes longer. Just before serving, add wine. Pour into tureen and sprinkle liberally with croutons and grated Parmesan or other Italian cheese.

Serves 6.

Our Sauerkraut Dinner

2½ lbs. sauerkraut	1 teaspoon salt
1 or 2 bay leaves	1 tablespoon water
½ teaspoon pepper	2 lbs. cubed, mixed beef, veal and pork
1 cup water	1 tablespoon sugar
¼ cup shortening (lard preferred)	1 cup commercial sour cream
1 minced, medium onion	
1 teaspoon paprika	

Rinse sauerkraut in cold water, place in kettle, and add bay leaves, pepper, and cup water. Let mixture simmer in covered kettle ½ hour, stirring occasionally with fork, adding water when necessary. Meanwhile, in Dutch oven heat shortening; add onion and sauté until glossy, then add paprika, salt, tablespoon of water, and meat. Cover Dutch oven and let meat simmer slowly ½ hour, stirring occasionally. Stir in sauerkraut and sugar and continue cooking covered for 1½ hours or until meat is very tender. Stir in sour cream and serve at once.

Serves 6 generously.

Herman Hickman *Sports Authority*

Chicken Hickmano

¾ cup butter or margarine	1 teaspoon oregano
½ cup olive oil	2 teaspoons salt
4 minced cloves garlic	1¼ teaspoons freshly ground pepper
3 minced medium onions	½ cup flour
2 pared, grated carrots	8 to 10 whole, boned chicken breasts
¼ cup snipped parsley	1 lb. Mozzarella cheese (8 to 10 slices)
1 No. 2½ can Italian tomatoes	Parmesan cheese, freshly grated
4 6-oz. cans tomato paste	

In Dutch oven, heat ½ cup butter or margarine and ¼ cup olive oil. Add garlic, onions, carrots, parsley, and sauté until tender.

Now add tomatoes and tomato paste. Let mixture simmer uncovered 30 minutes. Then add oregano, 1 teaspoon salt and one teaspoon pepper. Allow it to simmer another half hour. Meanwhile, start heating oven to 350° F. In paper bag combine flour and rest of salt and pepper. Then add chicken breasts to bag, several at a time, and shake. Next heat in skillet until quite hot, remainder of butter or margarine and olive oil. Add chicken breasts to skillet and sauté slowly until golden brown on all sides and quite tender. Place one piece of chicken in each individual casserole. Then top each with slice of Mozzarella cheese. Place casseroles in oven and bake, uncovered, about 15 minutes, or until cheese is melted but not hard. Now spoon generous helpings of sauce over chicken in each casserole, and serve at once, passing Parmesan cheese.

Serves 8 to 10.

Elmo Roper *Public Opinion Expert*

Beef Stew with Red Wine

2 lbs. boneless chuck, trimmed of fat	¼ cup hot butter or margarine
1 cup dry red wine	1½ cups water
½ cup flour	1 lb. small white onions
½ teaspoon salt	6 sliced, scraped carrots
½ teaspoon pepper	2 teaspoons salt

Cut boneless chuck into 1" pieces, place in bowl, and pour wine over it. Let stand in refrigerator 2 to 12 hours or overnight. In paper bag, mix flour, ½ teaspoon salt, and pepper. Drain meat, reserving wine. Shake meat a few pieces at a time in bag to coat with flour. Then brown well on all sides in shortening in Dutch oven. Stir in 1/3 cup reserved wine and water. Bring to boil, stirring. Simmer, covered, over low heat, 2 hours, stirring occasionally. Then add another 1/3 cup reserved wine, onions and carrots. Simmer, covered, 30 minutes, and stir in remaining reserved wine and 2 teas-

spoons salt. Simmer, covered, 40 min., or until vegetables are tender. Serve over hot, cooked noodles.

Makes 6 servings.

Double-Thick Rare Steak

- | | |
|-------------------------------|--------------------------------|
| 1 cut clove garlic | 1 tablespoon |
| $\frac{1}{2}$ cup crumbled | lemon juice |
| blue cheese | 1 teaspoon salt |
| $\frac{1}{4}$ cup soft butter | $\frac{1}{2}$ teaspoon freshly |
| or margarine | ground pepper |
| 1 teaspoon Wor- | |
| cestershire | Porterhouse |
| 1 tablespoon pre- | steak, 3-inches |
| pared mustard | thick |

Preheat broiler and rack 10 minutes. Then rub steak with garlic. Arrange on broiler rack with top of steak 5 inches below heat. If you can't place steak this low and it browns too quickly, lower heat toward end of broiling period. Broil 20 to 25 minutes on first side, or until well browned. Meanwhile, cream together well cheese, margarine, Worcestershire, mustard, lemon juice, salt and pepper. Then turn steak and broil on other side 20 to 25 minutes. Now cut into steak near bone and check rareness. Broil longer if necessary. Then spread cheese mixture on steak and broil 5 minutes longer or until topping is golden brown. Serve at once on hot platter.

Serves 6 to 8.

Christmas Cake

- | | |
|------------------------------|---------------------------|
| 4 cups milk | $\frac{1}{3}$ cup cherry |
| 2 envelopes un- | juice |
| flavored gela- | 1 teaspoon va- |
| tine | vanilla extract |
| 2 egg yolks | 2 egg whites, |
| $\frac{3}{4}$ cup granulated | beaten until |
| sugar | stiff |
| $\frac{1}{4}$ teaspoon salt | $1\frac{1}{2}$ cups heavy |
| $\frac{3}{4}$ cup chopped | cream, |
| maraschino | whipped |
| cherries | Packaged va- |
| | vanilla wafers |

Place 1 cup of milk in small bowl and

sprinkle in gelatine. Allow it to soften. In double boiler, scald 3 cups of milk, meanwhile beating egg yolks with fork. Pour some of scalded milk, gelatine, sugar and salt into egg yolks, return this to rest of scalded milk, and cook, stirring, until mixture coats spoon. Allow mixture to cool a few minutes; then add cherries, cherry juice, and vanilla extract. Now refrigerate mixture, stirring occasionally until it is completely cold and begins to thicken. Then fold in beaten egg whites and half of whipped cream. Lightly butter a 9" clamppless spring-form pan with round insert in place. Line bottom and sides of pan with vanilla wafers, pour in filling, and arrange more vanilla wafers on top. Refrigerate at least 12 hours. At serving time, unmold cake and frost sides and top with rest of whipped cream.

Serves 8 to 10.

Ham-and-Chicken Casserole

- | | |
|--------------------------------|-----------------------------|
| 1 cup regular or | cheese ($\frac{1}{4}$ lb.) |
| processed rice | Dash nutmeg |
| $1\frac{1}{2}$ lb. slice fully | and pepper |
| cooked ham | 2 cups diced |
| $\frac{2}{3}$ cup minced | cooked chicken |
| onions | $\frac{1}{4}$ cup pimento |
| 3 cups medium | strips |
| white sauce | $\frac{1}{2}$ cup buttered |
| 1 cup diced, | fresh bread- |
| process sharp | crumbs |
| American | |

Cook rice as label directs. Meanwhile, trim some fat from ham, place fat in skillet, and heat. When skillet is hot, remove fat, add ham slice, and sauté until golden. Then cut ham into strips. In fat left in skillet, sauté minced onions until tender. Stir onions into white sauce and add cheese, nutmeg, pepper and chicken. Then, into 3-qt. casserole, spoon just enough rice to cover bottom. Add layer of ham, more rice, then layer of sauce, repeating until all are used, ending with sauce. Garnish with pimento strips and bread crumbs. Bake mixture at 350° F. until bubbles.

Serves 8.

Thin Veal Forestier

1½ lbs. veal outlet cut into very thin slices and then pounded even thinner
1 clove garlic
Flour
¼ cup butter or margarine
½ lb. mushrooms, sliced thin

½ teaspoon salt
Dash pepper
⅓ cup dry vermouth
1 teaspoon lemon juice (fresh, frozen, or canned)
Snipped parsley

Rub veal all over with garlic. Then dip into flour, coating each side well. In skillet heat shortening till quite hot, add veal slices, several at a time, and sauté until golden brown on each side. Heap mushrooms on top of veal and sprinkle them with salt, pepper and vermouth. Cover skillet and allow to cook over low heat about 20 minutes or until fork-tender. Lift cover occasionally to be sure veal is moist. If necessary, add a tablespoon of water. Just before serving, sprinkle with lemon juice and parsley. If preferred, a chafing dish may be used to complete the cooking after the veal has browned. *Serves 6*

Professor Carl Carmer Author

Election Cake

1 pkg. hot roll mix
1 cup butter or margarine
1 cup granulated sugar
½ cup commercial sour cream
1 egg, unbeaten
1¼ cups sifted,

all-purpose flour
½ teaspoon baking soda
⅓ teaspoon nutmeg
¾ cup currants
¾ cup chopped walnuts

Make up hot roll mix as label directs, but don't let rise. Into 1 cup dough blend shortening, sugar, sour cream and egg. Let remaining dough rise and bake as rolls to be served later. Sift together flour, baking soda and nutmeg and mix lightly with currants and walnuts. Stir flour mixture into dough mixture. Turn dough into greased, 10" x 5" x 3" loaf pan. Cover, let rise in warm place, 80° to 85° F., 1 hour. Bake cake at 325° F. 1 to 1¼ hours or until cake tester inserted in center comes out clean. Cool in pan on cake rack. Best made day or so ahead of serving. *Makes 1 loaf.*

ROADSIDE INNS

Where Travelers in America Can Find Superb Cooking

Northeast

SNOWBERRY'S LOBSTER HOUSE, Pine Point, Maine, sits on the shore by the Atlantic. It serves lobsters, clams and other local seafood.

LOVETT'S, Franconia, N. H., is a 160-year-old farmhouse with Early American decor and American cooking.

THE SHELburne HARBOUR INN, Shelburne, Vt., is a Georgian mansion on Lake Champlain. Menu is mostly French.

NEWFANE INN, in Newfane, Vermont, was built in 1787, serves French and Italian dishes as well as local fare.

GUNDLACH'S HOFBRAU HOUSE, Plainville, Mass., is a clapboard farmhouse where guests get German-American cooking, German wines.

THE TOLL HOUSE, Whitman, Mass., dates from 1709. Its staple is New England cooking, but it offers a different foreign dish each week.

HILLINGSWORTH, East Brewster, Mass., a gray shingle house on the bay side of Cape Cod, serves French food.

THE WHALE INN, Goshen, Mass., a farmhouse, serves American food.

THE FERRY TAVERN, Old Lyme, Conn., was once a Connecticut River ferry station. Its specialty is seafood.

SIMSBURY HOUSE, Simsbury, Conn., is a Victorian mansion whose dining room, terrace, carriage house are used for dining. Menu is American.

THE KREBS, Skaneateles, N. Y., serves American dishes like strawberry shortcake or ham with sherry-maple glaze.

LA CREMAILLERE A-LA-CAMPAGNE, Banksville North Castle, N. Y., occupies an old farmhouse, 35 miles outside N.Y.C., cuisine and wines are French.

BIRD AND BOTTLE, built in 1761 in Garrison, N. Y., as Warren's Tavern. Two types of food, Creole and native, are served under old maples or indoors.

THE SILVER HORN, Millbrook, N. Y., a remodeled old Quaker meeting-house, serves steaks from its own Angus cattle.

THE SWISS TAVERN, Pompton Lakes, N. J., has a Swiss menu featuring *truite au bleu*, veal in white wine.

THE TOW-PATH HOUSE, New Hope, Pa., an old canal station, specializes in lobster thermidor. Guests eat on terraces by a stream.

THE PIPERSVILLE INN, Pipersville, Pa., is an old brick Pennsylvania Dutch inn serving table d'hôte German cooking—in large portions.

South

THE GRANARY, built in Georgetown, Md., 130 years ago as a grain depot, specializes in steaks and Chesapeake rockfish.

OLNEY INN, Olney, Md., is a spacious shingled farmhouse where mint juleps are served on wide lawns under the elms. The menu is American.

THE MILTON INN, Sparks, Md., built in 1740 of native fieldstone. Its specialties are Maryland Crab Imperial, Cold Shrimp Louis, chicken lobster and Rock Cornish game hen.

THE TIDES INN, at Irvington, Va., on Rappahannock River, has dock for yachts, serves spoon bread and oyster stew made from colonial recipes.

THE BEAUMONT INN, Harrodsburg, Ky. This hundred-year-old inn upholds local southern dishes like Kentucky ham, littlepig sausages, fried apples and cheese pie.

THE NU-WRAY INN, Burnsville, N. C., a mountain inn built around a 125-year-old log house, serves southern, family-style meals at set hours.

THE SQUIRREL INN, Summerville, S. C., offers continental food and good wine in a setting of azaleas and Spanish moss.

CHALET SUZANNE, Lake Wales, Fla., has an international cuisine to fit decorations imported from Spain, Italy, Egypt and Scandinavia.

OLD TALBOTT TAVERN, Bardstown, Ky., a white brick inn, serves Kentucky dishes like ham with red-eye gravy.

SPRING LAKE RESTAURANT, Bellefonte, Ark., has glassed-in dining room out over trout pond. Menu has trout, catfish.

THE STAGECOACH INN, Salado, Texas, along the old Chisholm trail, was once patronized by Jesse James and General Custer. It offers Texan fare, such as steaks and hush puppies.

North Central

THE GOLDEN LAMB INN, Lebanon, Ohio, state's oldest inn, is famous for Virginia ham, blackbottom pudding, sour cream dishes.

THE OLD BARN INN, St. Albans, Mo., formerly a cow barn, offers an American menu with lavish desserts on terraces near a pool.

THE OLD OLTZ HOUSE, Creve Coeur, Mo., cooks on order guinea hen, fresh rainbow trout and duckling with wine sauce.

THE FOX AND HOUNDS, Hubertus, Wis. (near Milwaukee), is a log house in kettle moraine hills. A specialty is roast duck with wild rice.

THE LOWELL INN, Stillwater, Minn. on the St. Croix River, has indoor pool from which patrons select their brook trout.

THE OX YOKE, Amana, Iowa, is one of four good family-style Amana Society eating places in the community. Food is German.

THE MILK PAIL, Dundee, Illinois, offers a variety of game birds and fish from its own preserve.

West

BONANZA INN, Wally Hot Springs, Nev., dates from Gold Rush days. Varied cuisines including a huge smorgasbord.

THE COUNTRY KITCHEN, Littleton, Colo., features smorgasbord with choice of 70 Swedish dishes in a chink-log mountain cabin.

THE COPPER KETTLE, Aspen, Colo., once a mining post, specializes in dishes from six countries—a different specialty each night.

ARDOVINO'S, Anapra, N. Mex. (near El Paso), is isolated white ranch house with windmill overlooking swimming pool. Cooking is Italian.

LA POSTA, Mesilla, N. Mex., an old adobe training post in desert country, has Mexican food but also serves steaks and western dishes.

PARRY LODGE, Kanab, Utah, near the Grand Canyon, is a rambling white house serving American dishes like pot roast or stewed chicken.

OJAI VALLEY INN, Ojai, Calif., has a country club atmosphere, looks out to the Santa Ynez Mountains, offers elaborate suppers and buffets.

APPLE VALLEY INN, Victorville, Calif., is a stone-and-redwood ranch resort with a huge outdoor barbecue pit and a 30-foot-long buffet.

THE NEPENTHE, Big Sur, Calif., has a barbecue pit at the brink of a high cliff over the Pacific. The menu is international.

LITTLE RIVER INN, near Mendocino, Calif., is a farmhouse overlooking the Pacific. Specialties are abalone dishes and fresh berry desserts.

SNOQUALMIE FALLS LODGE, 29 miles east of Seattle, offers a magnificent view with its northwestern dishes. Specializes in big Sunday breakfast.

MON DESIR, Central Point, Ore., is an old country home with landscaped gardens. Specialty is marinated prime ribs with home-grown herbs.

THE CRAB BROILER, Seaside, Ore., serves local crabs, oysters and razor clams in an English tavern style setting.

THE ALDERBROOK INN, Union, Wash., is a rambling white lodge on the Hood Canal featuring local salmon and seafood.

HEADLINE HISTORY OF OUR TIMES

Based on Newspaper Accounts of Important Events

The Headline History is based on the date when historical events came to the knowledge of the public through the newspapers. The events themselves may have occurred at a different date. For events previous to Headline History, see Page 758, for Historical and News Events from Ancient to Modern Times. This is compiled by the Encyclopaedia Britannica staff, and it begins with the Battle of Actium in 31 B.C. This includes a chronology of World War I.

1917

Mar. 8—Russian Revolution begins.

Mar. 15—Tsar Nicholas II abdicates.

Apr. 6—U. S. enters World War I.

Apr. 16—Lenin and other exiled Bolshevik leaders arrive in Petrograd from Switzerland; were allowed to pass through Germany in sealed railroad car.

Nov. 6-7—Bolsheviks overthrow Kerensky, seize power.

1918

Jan. 8—Wilson's 14-point address to Congress calls for self-determination, removal of economic barriers, League of Nations.

Mar. 3—Russia makes separate treaty with Central Powers at Brest-Litovsk.

July 16—Tsar Nicholas II and family shot.

Nov. 11—World War I ends.

1919

Mar. 2—3rd International founded.

June 28—Versailles Treaty signed.

Aug. 11—Germany becomes republic as Weimar Constitution is promulgated.

1920

Jan. 10—League of Nations officially inaugurated as Versailles Treaty goes into effect.

Jan. 16—1st League Council meeting in Paris. Permanent members: England, France, Italy, Japan. (Germany made permanent member 1926 upon admission to League; Russia, 1934.)

Jan. 16—Prohibition goes into effect.

Mar. 13-17—Kapp Putsch by monarchists results in brief seizure of Berlin government buildings; collapses as result of general strike.

Mar. 19—Senate finally rejects Treaty of Versailles because of League of Nations proviso.

Apr. 25—War between Russia and Poland begins. Treaty of Riga, Mar. 18, 1921, establishes Polish-Russian border.

May 19—Persia (now Iran) presents 1st dispute to League; demands Russia get out of Azerbaijan. Russia does.

Aug. 26—Woman suffrage amendment ratified.

1921

Mar. 8—Allies occupy Düsseldorf, Duisburg, Ruhrort because of reparations default; Germany accepts ultimatum, finances reparations May 11.

Mar. 17—New Economic Policy (NEP) in Russia permits private enterprise on small scale; small private farms, limited hired labor and leases permitted 1922.

1922

Feb. 6—Washington Conference guarantees China's integrity in 9-Power Treaty; establishes naval ratios of 5:5:3 for U. S., Britain and Japan.

Apr. 16—Treaty of Rapallo provides for economic co-operation between Germany and Russia.

June 15—1st meeting of Permanent Court of International Justice (World Court).

Sept. 21—Fordney-McCumber Tariff sets highest rates in American history.

Oct. 27—Mussolini marches on Rome.

1923

Jan. 11—French and Belgians occupy Ruhr because of reparations default.

Aug. 31—Italy, blaming Greece for death of Italian on Greek border, seizes Corfu; League intervenes; Italy withdraws; Greece to pay indemnity.

Nov. 8-9—Munich beer hall putsch led by Hitler put down; Hitler sentenced to 5 years, serves less than 1; writes *Mein Kampf* in jail.

Nov. 20—German mark falls to 4.2 trillion to dollar.

1924

Jan. 21—Lenin dies; struggle for power begins between Stalin and Trotsky.

Apr. 9—Dawes Plan reorganizes Reichsbank, revises reparations and lends Germany gold to back up currency.

May 26—Immigration quotas set: annual immigrants from each nation to be 2% of persons of that nationality residing in U. S. in 1890.

July 21—Leopold and Loeb sentenced to life imprisonment for kidnapping of 14-year-old boy.

1925

Apr. 26—Hindenburg elected President of Germany by minority vote.

July 10-21—Scopes evolution trial held in Dayton, Tenn.

Oct.—Locarno Conference held to insure peace, preserve boundaries.

1927

May 20-21—Lindbergh flies solo across Atlantic.

Aug. 23—Sacco and Vanzetti executed.

Nov.—Trotsky expelled from Communist party.

1928

Aug. 27—Kellogg-Briand Pact signed; 15 nations (eventually 62) outlaw war; ratified by Senate Jan. 15, 1929.

Oct. 1—Russia's 1st 5-Year Plan begins.

1929

June 7—Young Plan establishes Bank for International Settlements; reduces reparations.

Oct. 24—Worst stock crash wipes out thousands of accounts.

1930

Apr. 22—London naval pact signed by U. S., Britain, France, Italy, Japan; Japan benefits by revision of naval ratio.

1931

Apr. 14—Alfonso XIII quits Spain; Alcalá Zamora becomes President of provisional republic.

May 11—Austrian Credit Anstalt fails; 6,000,000 unemployed by 1932.

Sept. 18-19—Explosion on Manchurian railway serves as pretext for Japan to begin occupation of Manchuria.

1932

Jan. 7—Stimson Doctrine: U. S. will not recognize gains achieved by armed force; recognition of Manchukuo withheld.

Jan. 22—Reconstruction Finance Corporation (RFC) established.

Jan. 28—Japan begins invasion of international settlement of Shanghai.

June 7—Bonus March on Washington, D. C.

July 31—Nazis elect 230 to Reichstag, Socialists 133, Centrists 97, Communists 89.

Aug. 13—Hitler refuses Vice-Chancellorship; demands all or nothing.

Oct. 31—Hoover warns "grass will grow in streets" under New Deal.

Nov. 6—German election fails to break deadlock; Nazis lose 2,000,000 votes.

1933

Jan. 30—Hitler made Chancellor of Germany by Hindenburg.

Feb. 15—FDR misses assassination at Miami; Mayor Cermak of Chicago fatally wounded.

Feb. 27—German Reichstag building burns; Communists accused.

Mar. 5—Reichstag elections give Nazis and Nationalist allies 52% of vote.

Mar. 6—Roosevelt proclaims bank holiday; embargoes gold.

Mar. 12—FDR's first "Fireside Chat."

Mar. 23—Reichstag gives Hitler blanket powers for 4 years; 94 Social Democrats opposed; many Social Democrats and all Communists under arrest or in hiding.

Mar. 27—Japan gives notice of quitting League (effective 1935).

Mar. 28—Nazis begin systematic boycott of Jewish businessmen, doctors, lawyers.

Mar. 31—Civilian Conservation Corps (CCC) to relieve unemployment and aid reforestation and flood control.

Apr. 19—U. S. goes off gold standard.

May 18—Tennessee Valley Authority (TVA) established.

June 12-July 27—London Economic Conference attempts to stabilize currencies; defeated by FDR's opposition.

June 16—National Industrial Recovery Act (NIRA) signed. Declared unconstitutional May 27, 1935.

Oct. 14—Hitler's Germany gives notice of quitting League (effective 1935).

Oct. 17—Einstein arrives in U. S. from Germany.

Nov. 12—92% of all voters cast ballots for Nazis in 1-party election; 3,000,000 invalid ballots register opposition.

Nov. 16—U. S. and Russia resume full relations at 11:50 P.M. EST.

Dec. 5—Prohibition ends in U. S.

1934

- Jan. 10*—Van der Lubbe, Dutch Communist, beheaded for Reichstag fire.
- Jan. 31*—Gold value of U. S. dollar cut to \$.5906.
- Mar. 24*—FDR signs Tydings-McDuffie Act giving Philippines independence on July 4, 1946.

- Aug. 31*—Neutrality Act, resulting from Ethiopian crisis, requires President to ban arms sales to nations he declares at war.
- Sept. 10*—Huey Long dies from being shot Sept. 8.
- Sept. 15*—Nuremberg laws deprive Jews of citizenship and bar intermarriage.
- Oct. 3*—Italy invades Ethiopia.
- Oct. 7*—League of Nations condemns Italy.
- Nov. 9*—Committee for Industrial Organization, headed by John L. Lewis, organized within AFL; expelled in 1937; becomes Congress of Industrial Organizations (CIO) in Nov. 1938.

Nov. 18—League economic and financial sanctions against Italy go into effect. (Embargo on oil never applied.)

1936

- Jan. 15*—Japan withdraws from naval conference at London; U. S., France, Britain sign pact Mar. 25.
- Jan. 20*—George V dies; Prince of Wales becomes Edward VIII.
- Feb. 16*—Spanish Popular Front (republicans and leftists) wins parliamentary elections.
- Mar. 7*—Hitler sends German troops into Rhineland, defying Versailles Treaty; denounces Locarno Pact.
- Apr. 3*—Bruno Richard Hauptmann electrocuted for kidnap-slaying (Mar. 1, 1932) of Lindbergh baby.
- May 9*—Ethiopia annexed to Italy.
- July 17*—Spanish civil war begins; troops led by Gen. Francisco Franco revolt in Spanish Morocco; uprisings follow all over Spain.
- Aug. 19-23*—Zinoviev and Kamenev executed in Russia as collaborators with Trotsky and Nazi secret police.
- Oct. 1*—Franco named Chief of State by rebels; establishes capital at Burgos.
- Oct. 27*—Rome-Berlin Axis formed.
- Nov. 18*—Italy and Germany recognize Franco regime in Spain.
- Nov. 25*—Japan signs anti-Comintern treaty with Germany; Italy adheres Nov. 6, 1937.
- Dec. 1-23*—Buenos Aires conference: 21 American republics pledge to consult if peace is imperiled; no nation to interfere with another's domestic affairs.
- Dec. 11*—Edward VIII abdicates; his brother becomes George VI.

1937

- Jan. 20*—FDR second inaugural sees "one-third of the nation ill-housed, ill-clad, ill-nourished."
- Feb. 2*—Sit-down strikers at Flint, Mich., defy court order telling them to evacuate.
- Feb. 5*—FDR asks power to enlarge Supreme Court to maximum of 15 Justices; plan defeated by Senate July 22.
- May 1*—Neutrality Act further limits sales to belligerents.
- May 6*—German zeppelin *Hindenburg* burns at Lakehurst, N. J.
- May 28*—Chamberlain succeeds Baldwin as British Prime Minister.
- June 3*—Duke of Windsor (former Edward VIII of Britain) weds Wallis Warfield Simpson.
- June 12*—Marshal Tukhachevsky and 7 generals executed in Russia for espionage and high treason.

July 2—Amelia Earhart Putnam missing in Pacific in round-the-world flight.

July 7—Japan begins undeclared war on China; fighting continues throughout World War II until fall of Japan.

Oct. 5—FDR delivers speech calling for "quarantine" of aggressors.

Nov. 29—Britain and France agree to give Hitler colonies in exchange for peace.

Dec. 11—Italy gives notice of quitting League (effective 1939).

1938

Feb. 16—New Agricultural Adjustment Act signed; establishes parity payments, ever-normal granaries, crop insurance.

Feb. 20—Eden resigns as British Foreign Minister; charges Chamberlain "seeks to buy peace."

Mar. 12—Nazis seize Austrian government; Schuschnigg ousted.

June 25—Fair Labor Standards Act provides 40¢ minimum wage and 40-hour week, to be achieved within 8 and 3 years, respectively.

July 18—Douglas Corrigan lands in Dublin in "wrong way" flight.

Sept. 29-30—Britain, France, Italy, Germany in parley at Munich agree to dismemberment of Czechoslovakia; Chamberlain returns to London with "peace in our time."

Oct. 30—"Attack from Mars" radio program by Orson Welles causes panic.

Nov. 13—Mother Cabrini first American to be beatified by Vatican.

Nov. 13—Jews herded into camps; fined \$400,000,000 because of Vom Rath assassination.

1939

Feb. 27—Sit-down strikes outlawed by U. S. Supreme Court.

Mar. 15—Hitler enters Prague.

Mar. 28—Madrid surrenders to Franco Forces.

Apr. 1—Civil war ends in Spain; U. S. recognizes Franco government.

Apr. 28—Hitler rebuffs FDR's peace plea in Polish quarrel.

Apr. 30—New York World's Fair opens.

May 3—Litvinov retires as Commissar for Foreign Affairs, marking end of Western orientation in Soviet diplomacy; Vyacheslav M. Molotov succeeds him.

May 5—Poland refuses to yield Danzig to Hitler; offers to negotiate.

Aug. 24—Germany and Russia sign 10-year nonaggression pact.

Aug. 27—Hitler demands Danzig and Corridor; agrees Aug. 29 to negotiate;

asks for Polish delegation; considers plan rejected Aug. 31 when no Polish delegate appears; publishes 16-point peace plan, which Poland rejects.

Sept. 1—Germany invades Poland and annexes Danzig; Britain and France give Hitler ultimatum.

Sept. 3—Britain and France declare war.

Sept. 5—U. S. proclaims neutrality.

Sept. 17—Russia invades Poland.

Sept. 18—Nazi and Russian armies meet at Brest-Litovsk, Poland.

Sept. 28—Poland partitioned by Germany and Russia.

Nov. 4—FDR signs bill removing arms embargo; substitutes "cash and carry" trade with belligerents.

Nov. 30—Russia attacks Finland.

Dec. 14—Soviet Russia expelled from League for invading Finland.

Dec. 17—Admiral Graf Spee scuttled off Montevideo by Hitler order after fleeing British warships.

1940

Mar. 12—Finland surrenders.

Apr. 9—Nazis invade Denmark and Norway.

May 10—Nazis invade Netherlands, Belgium, Luxembourg.

May 10—Chamberlain resigns as Prime Minister; Churchill takes over.

May 12—Germans cross French frontier.

May 13—Churchill tells Britain he has "nothing to offer but blood, toil, tears and sweat."

May 14—Dutch surrender.

May 16—FDR asks \$1.8 billion for defense, 50,000 planes.

May 26-June 3—Dunkerque evacuation: about 335,000 out of 400,000 Allied soldiers rescued from Belgium by civilian and naval craft from Britain.

May 28—King Leopold surrenders Belgian army; Cabinet disowns him.

May 28—Council of National Defense established to co-ordinate industry transportation, finance and labor.

June 9—Norway surrenders.

June 10—Italy declares war on France and Britain; invades France.

June 10—FDR signs withholding tax.

July 25—Mussolini deposed; Badoglio is Premier.

Sept. 3—Allied troops land on Italian mainland.

Sept. 8—Italy surrenders.

Sept. 10—Nazis seize Rome.

Oct. 19-Nov. 1—Moscow Conference: Hull, Eden, Molotov pledge unity to win war and establish world organization; promise democratic Italy and free Austria.

1942

Jan. 2—MacArthur gives up Manila; fights on to hold Bataan and Corregidor.

Jan. 5—Consumer rationing begins in U. S. as auto tires are rationed.

Nov. 22-26—Cairo Conference: FDR, Churchill, Chiang-Kai-shek pledge defeat of Japan, free Korea.

Nov. 28-Dec. 1—Teheran Conference: FDR, Churchill, Stalin agree on invasion plans.

Dec. 26—Nazi battleship *Scharnhorst* sunk by British off Norway.

1944

Jan. 22—Allied troops land behind German lines at Anzio near Rome.

June 4—Rome falls to Allies.

June 6—D-Day: Allies land in France.

June 15—Germans begin robot-bomb attacks on England.

July 20—Hitler wounded in bomb plot.

Aug. 25—Paris liberated.

Oct. 20—American troops invade Philippines.

Dec. 16—Germans launch counteroffensive in Belgium (Battle of Bulge).

1945

Jan. 12—German line crumbles; Allies regain 100 sq. mi. in "Bulge."

Feb. 3—U. S. troops enter Manila.

Feb. 11—Yalta Agreement signed by FDR, Churchill and Stalin.

Feb. 19—Marines land on Iwo Jima; raise flag on Mt. Suribachi Feb. 23.

Apr. 1—U. S. invades Okinawa.

Apr. 12—FDR dies; Truman is President.

Apr. 25—U. N. parley opens at San Francisco.

Apr. 25—Americans and Russians meet on Elbe.

Apr. 28—Mussolini and mistress, Clara Petacci, killed by partisans.

Apr. 29—33,000 inmates of Dachau concentration camp freed by U. S. forces.

Apr. 30—Soviet flag raised over Reichstag in Berlin.

May 1—Grand Adm. Karl Doenitz takes command in Germany; death of Hitler announced.

May 2—Berlin falls.

May 7—Germany surrenders unconditionally (V-E Day).

June 26—U. N. Charter signed at San Francisco; goes into effect Oct. 24.

June 28—Polish government under Russian influence installed, despite protests of government-in-exile.

July 16—A-bomb test at Alamogordo, N. Mex. (announced Aug. 6).

July 17-Aug. 2—Potsdam Conference: Truman, Churchill (Attlee after July 28), Stalin establish council of foreign ministers to prepare peace treaties; plan German postwar government and reparations.

July 26—Attlee Prime Minister; Churchill is out.

July 28—U. S. Senate ratifies (89-2) U. N. Charter.

Aug. 6—A-bomb blasts Hiroshima.

Aug. 8—Russia declares war on Japan.

Aug. 9—Nagasaki hit by A-bomb.

Aug. 14—Japan surrenders.

Sept. 2—Japanese sign surrender terms aboard battleship *Missouri* (V-J Day).

Oct. 24—U. N. officially established.

Nov. 15—Truman, Attlee and Mackenzie King decide in Washington Conference that A-bomb secrets will not be shared until U. N. adopts control plan.

Dec. 27—Moscow Conference, attended by Byrnes, Molotov and Bevin, makes preliminary plans for atomic-energy control, peace treaties and Korea.

1946

Jan. 10—1st meeting of U. N. General Assembly opens in London.

Jan. 17—1st meeting of Security Council opens in London.

Jan. 19—Iran presents 1st case to Security Council; demands Russia get out of Azerbaijan; Russia withdraws May 6.

Feb. 2—Trygve Lie installed as 1st U. N. Secretary-General.

Apr. 3—1st meeting of International Court opens in The Hague (formal opening Apr. 18).

Apr. 3—Japanese Lt. Gen. Homma executed; ordered Bataan Death March.

Apr. 8-18—Final Assembly session at Geneva dissolves League of Nations.

Apr. 29—U. S. proposes treaty with Britain, Russia and France to keep Germany disarmed 25 years; Russia cool to idea.

May 31—U. S. and Britain demand free elections in Rumania.

July 1—Underwater atom bombing at Bikini. (Repeated July 25.)

Oct. 1—Verdict in Nuremberg war trial: 12 Nazi leaders (including 1 tried in absentia) sentenced to hang; 7 imprisoned; 3 acquitted.

Oct. 15—Goering commits suicide a few hours before 10 other Nazis are executed Oct. 16.

Nov. 9—Truman ends all price and wage controls, except on rent, sugar and rice.

Dec. 3—Greece charges Albania, Bulgaria and Yugoslavia with aiding Communist rebels in northern part of Greece.

Dec. 4—Judge Goldsborough fines John L. Lewis \$10,000 and UMW \$3.5 million for contempt in disobeying Court order.

Dec. 19—Fighting breaks out in Indo-China between French and Reds.

Dec. 30—U. N. Atomic Energy Commission recommends (10-0) U. S. control plan; Russia and Poland abstain.

1947

Jan. 1—Britain nationalizes coal mines.

Jan. 28—U. S. rebukes Polish Communists for rigging election.

Feb. 10—Peace treaties for Italy, Rumania, Bulgaria, Hungary, Finland signed in Paris.

Mar. 4—Russia rejects U. S. plan for U. N. atomic-energy control.

Mar. 12—Truman asks Congress for \$400 million to save Greece and Turkey from Communist expansion (Truman Doctrine).

Apr. 14—General Motors settles wage dispute with United Electrical Workers (CIO) with increase equivalent to 15¢ per hour; sets pattern.

June 5—Secy. of State Marshall says U. S. may have to spend billions to put Europe on its feet economically (Marshall Plan).

June 23—Taft-Hartley Labor-Management Relations Act passed over Truman's veto.

July 12-15—16 nations meet in Paris to study Marshall Plan (Russia and 8 others stay away).

Aug. 1—Security Council calls on Dutch and Indonesians to cease hostilities.

Aug. 15—India freed by Britain.

Aug. 31—U. N. investigating committee recommends Britain give up control of Palestine and that Arab and Jewish states be established.

Oct. 5—Moscow announces formation of new 9-nation Communist Information Bureau (Cominform).

Nov. 14—General Assembly votes commission to set up free government for all of Korea.

Nov. 20—Princess Elizabeth married to Lt. Philip Mountbatten.

1948

Jan. 17—U. N. Good Offices Commission effects truce in Indonesia.

Jan. 30—Gandhi assassinated.

Feb. 23-25—Communists seize power in Czechoslovakia.

Mar. 10—Czech For. Min. Jan Masaryk plunges to death.

Apr. 20—Federal Court fines John L. Lewis \$20,000 and UMW \$1.4 million for criminal contempt for failure to call off strike within week, as ordered by Court.

Apr. 21—Security Council votes plebiscite in Kashmir to decide whether province goes to India or Pakistan; both sides object.

May 14—Nation of Israel proclaimed; British end mandate at midnight; Arab armies attack.

May 25—General Motors grants 11¢ hourly wage increase to UAW; wages to move up or down according to living costs—first escalator clause.

June 11—U. N. appeal brings temporary truce in Palestine.

June 18—Russia stops traffic between Berlin and Western occupation zones in Germany.

June 21—Berlin airlift begins; ends May 12, 1949.

June 22—Russian veto prevents Security Council from approving atomic-control plan favored by majority.

June 28—Stalin and Tito break.

Aug. 15—Independent Republic of Korea is proclaimed, following election supervised by U. N.

Nov. 4—General Assembly approves U. S.-sponsored atomic control plan.

Nov. 12—Verdict in Japanese war trial: Tojo and 6 others sentenced to hang (hanged Dec. 23); 18 imprisoned.

1949

Jan. 7—Cease-fire in Palestine.

Jan. 20—Truman proposes Point 4 Program to help world's backward areas.

Feb. 8—Cardinal Mindszenty sentenced in Hungary to life imprisonment.

Feb. 24—Israel signs armistice with Egypt.

Apr. 4—Start of NATO; treaty signed by 12 nations.

May 11—U. N. admits Israel.

Sept. 21—German Federal Republic (West Germany) established.

Sept. 24—Truman discloses Russia has set off atomic explosion.

Oct. 14—11 top Communist leaders in U. S. found guilty of advocating overthrow of government.

Oct. 16—Greek rebels announce end of military operations.

Oct. 26—Minimum wage raised to 75¢.

Dec. 8—Nationalist Chinese government moves to Formosa.

1950

Jan. 13—Russia boycotts Security Council (until Aug. 1) because Red China was refused admittance to U. N.

Jan. 21—Alger Hiss convicted of perjury in denying he gave U. S. secrets to Whittaker Chambers for Communists.

Jan. 31—Truman orders development of hydrogen bomb.

Feb. 11—Sen. Joseph R. McCarthy (R. Wis.) says 57 Communists are working in State Dept.

Mar. 1—Britain sentences Dr. Klaus Fuchs to 14 years in prison for giving atomic secrets to Russia.

June 25—North Koreans cross 38th parallel to invade South Korea.

June 27—Truman orders U. S. air and sea aid to South Koreans.

June 27—Security Council (at that time boycotted by Russia) calls on U. N. members to help repel North Korean aggression.

June 28—Reds capture Seoul.

July 8—Truman names MacArthur commander of U. N. forces in Korea.

Sept. 26—MacArthur announces capture of Seoul.

Oct. 7—U. S. 1st Cavalry make 1st U. S. crossing of 38th parallel.

Nov. 20—U. S. 7th Division unit reaches Manchurian border.

Nov. 26—Chinese open massive offensive; hurl U. N. forces back.

Dec. 19—Eisenhower named commander of NATO forces in Europe.

1951

Feb. 1—General Assembly condemns (44-7) Red China as an aggressor.

Mar. 19—6 nations initial Schuman Plan to pool European coal and steel market. (In effect Feb. 10, 1953.)

Mar. 24—MacArthur intimates U. N. will attack Red China; says he will meet with Reds at any time for truce talks.

Apr. 5—Julius and Ethel Rosenberg sentenced to death as atom spies.

Apr. 11—Truman removes MacArthur from all commands.

June 23—Russia proposes truce.

July 10—Truce talks begin in Korea.

Aug. 21—U. S. orders construction of world's 1st atomic submarine.

Sept. 8—Japanese peace treaty signed in San Francisco by 49 nations.

Oct. 26—Churchill again Prime Minister.

1952

Feb. 6—George VI dies; his daughter becomes Elizabeth II.

Feb. 20-25—NATO conference approves European Army; sets goal of 50 divisions and 4,000 planes by end of 1952.

Apr. 8—Truman seizes steel industry to prevent nation-wide strike.

May 26—Western Allies and West Germany sign peace contract at Bonn.

May 27—6 nations sign European Defense Community treaty at Paris.

June 2—Supreme Court (6-3) rules Truman's seizure of steel mills unconstitutional; mills returned to owners; USW goes on strike to July 24.

1953

Mar. 5—Stalin dies.

Mar. 6—Malenkov becomes Soviet Premier; Beria is Minister of Interior; Molotov is Foreign Minister.

Apr. 10—Dag Hammarskjöld begins term as U. N. Secretary General.

May 22—Eisenhower signs Off-Shore Oil Law giving states rights to minerals in submerged lands within their boundaries.

May 29—Mt. Everest climbed by British expedition.

June 2—Coronation of Elizabeth II.

June 8—Agreement on POWs reached at Panmunjom; India to head 5-nation commission for custodianship of POWs refusing repatriation.

June 17—East Berliners rise against Communist rule; quelled by tanks.

June 18-21—Pres. Rhee frees 27,000 anti-Red POWs in defiance of U. N.-Red prisoner agreement; truce talks halted June 20.

June 19—Rosenbergs executed.

July 10—Beria is imprisoned on charges of treason; executed Dec. 23.

July 10—Truce talks are resumed.

July 27—Korean armistice signed.

Aug. 5-Sept. 6—POWs exchanged in "Operation Big Switch"; 12,760 released by Reds, 75,799 by U. N.; U. N. believes Reds hold many back.

Aug. 20—Moscow announces explosion of hydrogen bomb.

Dec. 23-21 U. S. POWs turn down repatriation; prefer communism.

1954

Jan. 21—1st atomic-powered submarine, *Nautilus*, launched at Groton, Conn.

Jan. 26—U. S. Senate ratifies (81-6) mutual security treaty with Republic of Korea.

Mar. 1-5 Congressmen wounded as 3 Puerto Rican nationalists fire from House gallery.

Apr. 4—Arturo Toscanini resigns as conductor of NBC Symphony Orchestra.

Apr. 22-June 17—Army vs. McCarthy inquiry; subcommittee report Aug. 31 blames both sides.

Apr. 26—19-nation conference on Korea and Indo-China opens in Geneva.

May 7—Dienbienphu falls to Indo-China Red rebels.

May 17—U. S. Supreme Court unanimously bans segregation in public schools.

June 18—Anti-Communist exiles invade Guatemala; revolt ends July 2.

July 21—Indo-China truce signed at Geneva conference; Reds get half of Vietnam.

- Aug. 6—Emilie Dionne, one of quintuplets, dies at 20.
- Sept. 6—Eisenhower launches world atomic pool without Russia.
- Sept. 8—8-nation Southeast Asia defense treaty signed at Manila.
- Oct. 23—West Germany is granted sovereignty and is admitted to NATO and Western European Union.
- Nov. 27—Alger Hiss (see Jan. 21, 1950) released after 44 months in prison.
- Dec. 2—Senate "condemns" Sen. McCarthy on 2 counts by 67-22 vote.

1955

- Jan. 17—Submarine *Nautilus* goes to sea under atomic power.
- Apr. 5—Churchill resigns; Eden succeeds him Apr. 6.
- Apr. 12—Scientists OK Salk vaccine.
- May 31—Supreme Court leaves school desegregation to regional Federal courts.
- July 11—Eisenhower cancels Dixon-Yates contract.
- July 16—Hungary releases Cardinal Mindszenty. (See Feb. 8, 1949.)
- Sept. 19—Argentina ousts Perón.
- Sept. 24—Pres. Eisenhower suffers coronary thrombosis in Denver.
- Sept. 27—Egypt to buy Soviet arms.
- Dec. 7—AFL and CIO merge.
- Dec. 14—U. N. admits 16 new members.

1956

- Jan. 10—Britain to fly 1,600 paratroopers to Cyprus as result of Middle East crisis.
- Feb. 22—U. S. releases 40,000 kg. of Uranium 235 (worth \$1 million) for peaceful atomic power at home and abroad.
- Mar. 9—Archbishop Makarios of Cyprus is sent into exile by Britain.
- Mar. 20—Khrushchev calls Stalin murderer. (Speech made Feb. 24.)
- Apr. 5—Victor Riesel, labor columnist, attacked by acid thrower; pronounced permanently blind May 4.
- Apr. 7—Spain proclaims Spanish Morocco independent after 44 years.
- Apr. 8—6 Marine recruits drown in disciplinary night march at Parris Island, S. C., led by S/Sgt. Matthew C. McKeon.
- Apr. 18—Grace Kelly and Prince Rainier III married in civil ceremony. (Religious ceremony Apr. 19.)
- May 21—First aerial H-bomb tested over Namu I., Bikini Atoll (10-million tons TNT equivalent).

- June 9—Eisenhower undergoes operation to relieve blockage of small intestine due to ileitis; physicians say he will be physically fit to run for reelection.
- June 12—Scientists report radiation is peril to future of race.
- June 28-30—Workers' uprising against Communist rule in Poznan, Poland is crushed by tanks.
- July 19—U. S. withdraws its offer to help Egypt build Aswan dam on Nile.
- July 26—Egypt announces seizure of Suez Canal control.
- Aug. 4—S/Sgt. Matthew McKeon found guilty.
- Aug. 16—Adlai E. Stevenson wins Democratic presidential nomination.
- Aug. 17—Sen. Estes Kefauver wins Democratic Vice-Presidential nomination.
- Aug. 22—Republicans unanimously renominate Eisenhower and Nixon.
- Sept. 29—France and Germany agree that the Saar will return to Germany Jan. 1.
- Oct. 19—Japan and Russia sign agreement ending technical state of war.
- Oct. 21—Polish Communists restore Wladyslaw Gomulka to power, as party First Secretary.
- Oct. 24—Soviet troops and tanks in Hungary fight anti-Communist rebellion, Imre Nagy is new premier.
- Oct. 26—82 nations agree at U. N. on new International Atomic Energy Agency for peaceful use of atom. U. S. offers it 11,000 lb. of Uranium 235.
- Oct. 29—Israel launches attack on Egypt's Sinai Peninsula and drives toward Suez Canal.
- Oct. 31—British air attacks begin in Egypt.
- Nov. 4—U. N. assembly votes to organize U. N. police force to restore peace to Egypt.
- Nov. 5—British and French invade Egypt at Port Said.
- Nov. 6—Eisenhower-Nixon win with 41 states to 7 for Stevenson-Kefauver.
- Nov. 6—British, French cease fire at Port Said and halt Suez advance.
- Nov. 21—U. S. admits first 60 Hungarians who fled from Soviet domination.
- Nov. 23—Russians kidnap Hungary's Premier Imre Nagy and replace him with Janos Kadar.
- Dec. 8—Christian A. Herter of Massachusetts becomes Under Secretary of State, succeeding Herbert Hoover, Jr.
- Dec. 12—U. N. General Assembly condemns Russia for aggression in Hungary. Vote: 55 yes, 8 no, 13 abstaining.
- Dec. 22—Anglo-French forces withdraw from Egypt.

(For later items see News Record of 1957.)

The Cairo Conference

Important provisions of the Conference, which was held Nov. 22-26, 1943:

The several military missions have agreed upon future military operations against Japan. The Three Great Allies expressed their resolve to bring unrelenting pressure against their brutal enemies by sea, land, and air. This pressure is already rising.

The Three Great Allies are fighting this war to restrain and punish the aggression of Japan. They covet no gain for themselves and have no thought of territorial expansion. It is their purpose that Japan shall be stripped of all the islands in the Pacific which she has seized or occupied since the beginning of the first World War

in 1914, and that all the territories Japan has stolen from the Chinese, such as Manchuria, Formosa, and the Pescadores, shall be restored to the Republic of China. Japan will also be expelled from all other territories which she has taken by violence and greed. The aforesaid Three Great Powers, mindful of the enslavement of the people of Korea, are determined that in due course Korea shall become free and independent.

With these objectives in view the three Allies, in harmony with those of the United Nations at war with Japan, will continue to persevere in the serious and prolonged operations necessary to procure the unconditional surrender of Japan.

The Teheran Conference

(Nov. 28-Dec. 1, 1943)

The President of the United States of America, the Premier of the Union of Soviet Socialist Republics, and the Prime Minister of the United Kingdom, have consulted with each other and with the Prime Minister of Iran, desire to declare the mutual agreement of their three Governments regarding relations with Iran.

The Governments of the United States of America, the Union of Soviet Socialist Republics and the United Kingdom recognize the assistance which Iran has given in the prosecution of the war against the common enemy, particularly by facilitating transportation of supplies from overseas to the Soviet Union. The three Governments realize that the war has caused special economic difficulties for Iran and they are agreed that they will continue to make available to the Government of Iran such economic assistance as may be possible, having regard to the heavy demands made upon them by their worldwide military operations and to the worldwide shortage of transport, raw materials and supplies for civilian consumption.

With respect to the post-war period, the Governments of the United States of America, the Union of Soviet Socialist Republics and the United Kingdom are in accord with the Government of Iran that any economic problem confronting Iran at the close of hostilities should receive full consideration along with those of the other members of the United Nations by conferences or international agencies held or created to deal with international economic matters.

The Governments of the United States of America, the Union of Soviet Socialist Republics and the United Kingdom are at one with the Government of Iran in their desire for the maintenance of the independence, sovereignty and territorial integrity of Iran. They count upon the participation of Iran together with all other peace-loving nations in the establishment of international peace, security and prosperity after the war in accordance with the principles of the Atlantic Charter, to which all four governments have continued to subscribe.

The Yalta Conference

Important provisions of the Conference, which was held Feb. 4-11, 1945:

The Occupation and Control of Germany

We have agreed on common policies and plans for enforcing the unconditional surrender terms which we shall impose together on Nazi Germany after German armed resistance has been finally crushed. These terms will not be made known until the final defeat of Germany has been accomplished. Under the agreed plan, the forces of the three powers will each occupy a separate zone of Germany. Coordinated administration and control has been provided for under the plan through a central Control Commission, consisting of

the supreme commanders of the three powers, with headquarters in Berlin. It has been agreed that France should be invited by the three powers, if she should so desire, to take over a zone of occupation, and to participate as a fourth member of the Control Commission. The limits of the French zone will be agreed upon by the four Governments concerned through their representatives on the European Advisory Commission.

It is our inflexible purpose to destroy German militarism and nazism and to ensure that Germany will never again be able to disturb the peace of the world. We are determined to disarm and disband all

German armed forces; break up for all time the German General Staff that has repeatedly contrived the resurgence of German militarism; remove or destroy all German military equipment; eliminate or control all German industry that could be used for military production; bring all war criminals to just and swift punishment and exact reparation in kind for the destruction wrought by the Germans; wipe out the Nazi Party, Nazi laws, organizations, and institutions, remove all Nazi and militarist influences from public office and from the cultural and economic life of the German people; and take in harmony such other measures in Germany as may be necessary to the future peace and safety of the world. It is not our purpose to destroy the people of Germany, but only when nazism and militarism have been extirpated will there be hope for a decent life for Germans, and a place for them in the comity of nations.

Terms Under Which Russia Entered the War Against Japan

The leaders of the Three Great Powers—the Soviet Union, the United States of America and Great Britain—have agreed that in two or three months after Germany has surrendered and the war in Europe has terminated the Soviet Union shall enter into the war against Japan on the side of the Allies on condition that:

1. The status quo in Outer Mongolia (The Mongolian People's Republic) shall be preserved;

2. The former rights of Russia violated by the treacherous attack of Japan in 1904 shall be restored, viz.:

- (a) the southern part of Sakhalin as well as all the islands adjacent to it shall be returned to the Soviet Union,

- (b) the commercial port of Dairen shall be internationalized, the preeminent interests of the Soviet Union in this port being safeguarded and the lease of Port Arthur as a naval base of the U.S.S.R. restored,

- (c) the Chinese-Eastern Railroad and the South-Manchurian Railroad which provides an outlet to Dairen shall be jointly operated by the establishment of a joint Soviet-Chinese Company, it being understood that the preeminent interests of the Soviet Union shall be safeguarded and that China shall retain full sovereignty in Manchuria;

3. The Kurile Islands shall be handed over to the Soviet Union.

It is understood, that the agreement concerning Outer Mongolia and the ports and railroads referred to above will require concurrence of Generalissimo Chiang Kai-shek. The President will take measures in order to obtain this concurrence on advice from Marshal Stalin.

The Heads of the Three Great Powers have agreed that these claims of the Soviet Union shall be unquestionably fulfilled after Japan has been defeated.

For its part the Soviet Union expresses its readiness to conclude with the National Government of China a pact of friendship and alliance between the U.S.S.R. and China in order to render assistance to China with its armed forces for the purpose of liberating China from the Japanese yoke.

The Potsdam Declaration

Text of the declaration issued at Potsdam, Germany, July 26, 1945, outlining the terms under which Japan would be allowed to surrender:

1. We, the President of the United States, the President of the national government of the Republic of China and the Prime Minister of Great Britain, representing the hundreds of millions of our countrymen, have conferred and agreed that Japan shall be given the opportunity to end this war.

2. The prodigious land, sea, and air forces of the United States, the British Empire and China, many times reinforced by their armies and air fleets from the west, are poised to strike the final blow at Japan. This military power is sustained and inspired by the determination of all allied nations to prosecute the war against Japan until she ceases to resist.

3. The result of the futile and senseless German resistance to the might of the aroused free peoples of the world stands forth in awful clarity as an example to the people of Japan.

The might that now converges on Japan is immeasurably greater than that which, when applied to the resisting Nazis, necessarily laid waste to the land, the industry, and the method of life of the whole German people.

The full application of our military power, backed by our resolve, will mean the inevitable and complete destruction of the Japanese armed forces and just as inevitably the utter devastation of the Japanese homeland.

4. The time has come for Japan to decide whether she will continue to be controlled by these self-willed militaristic advisers whose unintelligent calculations have brought the empire of Japan to the threshold of annihilation, or whether she will follow the path of reason.

5. The following are our terms: we will not deviate from them; there are no alternatives; we shall brook no delay.

6. There must be eliminated for all time the authority and influence of those

who have deceived and misled the people of Japan into embarking on world conquest, for we insist that a new order of peace, security, and justice will be impossible until irresponsible militarism is driven from the world.

7. Until such a new order is established and until there is convincing proof that Japan's war-making power is destroyed, points in Japanese territory to be designated by the Allies shall be occupied to secure the achievement of the basic objectives we are here setting forth.

8. The terms of the Cairo declaration shall be carried out and Japanese sovereignty shall be limited to the Islands of Honshu, Hokkaido, Kyushu, Shikoku and such minor islands as we determine.

9. Japanese military forces after being completely disarmed shall be permitted to return to their homes with the opportunity to lead peaceful and productive lives.

10. We do not intend that the Japanese shall be enslaved as a race or destroyed as a nation, but stern justice shall be meted out to all war criminals, including those who have visited cruelties upon our prisoners.

The Japanese government shall remove all obstacles to the revival and strength-

ening of democratic tendencies among the Japanese people. Freedom of speech and religion and of thought, as well as respect for the fundamental human rights, shall be established.

11. Japan shall be permitted to maintain such industries as will sustain her economy and permit the payment of just reparation in kind, but not those industries which will enable her to rearm for war.

To this end, access to, as distinguished from control of, raw materials shall be permitted. Eventual Japanese participation in world trade relations shall be permitted.

12. The occupying forces of the Allies shall be withdrawn from Japan as soon as these objectives have been accomplished and there has been established in accordance with the freely expressed will of the Japanese people a peacefully inclined and responsible government.

13. We call upon the government of Japan to proclaim now the unconditional surrender of all Japanese armed forces and to provide proper and adequate assurances of their good faith in such action. The alternative for Japan is prompt and utter destruction.

North Atlantic Treaty

Signed at Washington, D.C., April 4, 1949

The Parties to this Treaty reaffirm their faith in the purposes and principles of the Charter of the United Nations and their desire to live in peace with all peoples and all governments.

They are determined to safeguard the freedom, common heritage and civilization of their peoples, founded on the principles of democracy, individual liberty and the rule of law.

They seek to promote stability and well-being in the North Atlantic area.

They are resolved to unite their efforts for collective defense and for the preservation of peace and security.

They therefore agree to this North Atlantic Treaty:

Article 1

The Parties undertake, as set forth in the Charter of the United Nations, to settle any international disputes in which they may be involved by peaceful means in such a manner that international peace and security, and justice, are not endangered, and to refrain in their international relations from the threat or use of force in any manner inconsistent with the purposes of the United Nations.

Article 2

The Parties will contribute toward the further development of peaceful and friendly international relations by strength-

ening their free institutions, by bringing about a better understanding of the principles upon which these institutions are founded, and by promoting conditions of stability and well-being. They will seek to eliminate conflict in their international economic policies and will encourage economic collaboration between any or all of them.

Article 3

In order more effectively to achieve the objectives of this Treaty, the Parties, separately and jointly, by means of continuous and effective self-help and mutual aid, will maintain and develop their individual and collective capacity to resist armed attack.

Article 4

The Parties will consult together whenever, in the opinion of any of them, the territorial integrity, political independence or security of any of the Parties is threatened.

Article 5

The Parties agree that an armed attack against one or more of them in Europe or North America shall be considered an attack against them all; and consequently they agree that, if such an armed attack occurs, each of them, in exercise of the right of individual or collective self-defense recognized by Article 51 of the Charter of the United Nations, will assist the Party or Parties so attacked by taking forthwith,

individually and in concert with the other Parties, such action as it deems necessary, including the use of armed force, to restore and maintain the security of the North Atlantic area.

Any such armed attack and all measures taken as a result thereof shall immediately be reported to the Security Council. Such measures shall be terminated when the Security Council has taken the measures necessary to restore and maintain international peace and security.

Article 6

For the purpose of Article 5 an armed attack on one or more of the Parties is deemed to include an armed attack on the territory of any of the Parties in Europe or North America, on the Algerian departments of France, on the occupation forces of any Party in Europe, on the islands under the jurisdiction of any Party in the North Atlantic area north of the Tropic of Cancer or on the vessels or aircraft in this area of any of the Parties.

Article 7

This Treaty does not affect, and shall not be interpreted as affecting, in any way the rights and obligations under the Charter of the Parties which are members of the United Nations, or the primary responsibility of the Security Council for the maintenance of international peace and security.

Article 8

Each Party declares that none of the international engagements now in force between it and any other of the Parties or any third state is in conflict with the provisions of this Treaty, and undertakes not to enter into any international engagement in conflict with this Treaty.

Article 9

The Parties hereby establish a council, on which each of them shall be represented, to consider matters concerning the implementation of this Treaty. The council shall be so organized as to be able to meet promptly at any time. The council shall set up such subsidiary bodies as may be necessary; in particular it shall establish immediately a defense committee which shall recommend measures for the implementation of Articles 3 and 5.

Article 10

The Parties may, by unanimous agreement, invite any other European state in a position to further the principles of this

Treaty and to contribute to the security of the North Atlantic area to accede to this Treaty. Any state so invited may become a party to the Treaty by depositing its instrument of accession with the Government of the United States of America. The Government of the United States of America will inform each of the Parties of the deposit of each such instrument of accession.

Article 11

This Treaty shall be ratified and its provisions carried out by the Parties in accordance with their respective constitutional processes. The instruments of ratification shall be deposited as soon as possible with the Government of the United States of America, which will notify all the other signatories of each deposit. The Treaty shall enter into force between the states which have ratified it as soon as the ratifications of the majority of the signatories, including the ratifications of Belgium, Canada, France, Luxemburg, the Netherlands, the United Kingdom and the United States, have been deposited and shall come into effect with respect to other states on the date of the deposit of their ratifications.

Article 12

After the Treaty has been in force for ten years, or at any time thereafter, the Parties shall, if any of them so requests, consult together for the purpose of reviewing the Treaty, having regard for the factors then affecting peace and security in the North Atlantic area, including the development of universal as well as regional arrangements under the Charter of the United Nations for the maintenance of international peace and security.

Article 13

After the Treaty has been in force for twenty years, any Party may cease to be a party one year after its notice of denunciation has been given to the Government of the United States of America, which will inform the Governments of the other Parties of the deposit of each notice of denunciation.

Article 14

This Treaty, of which the English and French texts are equally authentic, shall be deposited in the archives of the Government of the United States of America. Duly certified copies thereof will be transmitted by that Government to the Governments of the other signatories.

Tripartite Security Treaty

(United States, Australia, New Zealand)

Major provisions of the Tripartite agreement signed on Sept. 1, 1951, at San Francisco:

1. The parties undertake to settle by peaceful means any international disputes in which they may be involved.

2. The parties will maintain and develop their individual and collective capacity to resist armed attack.

3. The parties will consult together whenever the territorial integrity, political

independence or security of any of the parties is threatened in the Pacific.

4. Each party recognizes that an armed attack in the Pacific area on either of the other parties would be dangerous to its own peace and safety.

5. The parties hereby establish a council, consisting of their foreign ministers or their deputies, to consider matters concerning the implementation of this treaty.

6. This treaty shall remain in force indefinitely.

A Defense Treaty similar in its provisions to the Tripartite Security Treaty was signed by the United States and the Philippines in Washington, D. C., Aug 30, 1951.

United States-Japanese Treaty

Main provisions of the U. S.-Japanese Security Treaty signed at San Francisco on Sept. 8, 1951:

1. Japan grants and the U. S. accepts the right to dispose U. S. land, air and sea forces in and about Japan. Such forces may be utilized to contribute to the maintenance of international peace and security in the Far East and to the security of Japan against armed attack from without, including assistance given at the express request of the Japanese government to put down large scale riots and disturbances in Japan caused through instigation or intervention by an outside power or powers.

2. Japan will not grant without the prior consent of the U. S. any bases or any rights, powers or authority whatsoever relating to bases, or the right of garrison or maneuver or transit of ground, air or naval forces of any third power.

3. This treaty shall expire whenever in the opinion of the governments of the U. S. and of Japan, U. N. arrangements or alternate individual or collective dispositions satisfactorily provide for the maintenance of international peace and security in the Japan area.

Japanese Peace Treaty

The Japanese Peace Treaty was signed at San Francisco on September 8, 1951, by 49 nations; the U.S.S.R., Poland and Czechoslovakia were present but refused to sign. Among the major provisions of the treaty are the following:

Peace: The state of war between Japan and the Allies is terminated.

Sovereignty: Japan's full sovereignty is recognized as is its right to apply for U. N. membership.

Territory: Japan recognizes the independence of Korea; renounces all rights, titles or claims to Formosa, the Pescadores, the Kuriles, Sakhalin, the Pacific islands formerly under mandate to Japan, the Antarctic area, Spratly Island and the Paracels.

Japan agrees to U. N. trusteeship over the Ryukyu and Daito Islands, the Bonins, Rosario Island, the Volcano Islands, Parece Vela and Marcus Island. Disposition of Japanese property on these islands is to be negotiated by Japan and the administering authorities.

Security: Japan agrees to settle its international disputes peaceably, to refrain from the threat of or the use of force and to abide by the principles of the U. N.

All occupation forces are to be withdrawn as soon as possible but not later than 90 days after a majority of the sig-

natory countries have given notice of ratification of this treaty. Nothing in this provision shall, however, prevent the stationing or retention of foreign armed forces in Japanese territory by agreement with one or more of the Allies.

Political-Economic Clauses: Japan may enter into fisheries treaties; may negotiate most-favored-nation trade and maritime treaties with the Allies; renounces all special rights and interests in China.

Japan accepts the judgments of the International Military Tribunal and Allied War Crimes Courts.

Claims and Property: Japan recognizes its responsibility to pay reparations but the Allies recognize its limited economic capacity; therefore, Japan shall pay through goods to be manufactured in Japan from raw materials provided by the victimized nations and by services. The Allies may retain certain properties seized from Japan but require the latter to return their properties within 6 months. Japan recognizes Allied industrial, literary and artistic property rights. It agrees to indemnify prisoners of war who suffered unduly but renounces similar claims against the Allies.

Settlement of Disputes: Any disagreements arising out of the interpretation of this treaty and not otherwise settled shall be submitted to the International Court of Justice.

(For treaties not listed here, see index.)

★ WHO'S WHO ★

Prepared with the Cooperation of

MARQUIS-WHO'S WHO Inc., Publishers of WHO'S WHO IN AMERICA

Locations and dates are those of birth. A name in parentheses is the original name or form of the name of the individual.

The vital statistics offered in this section have been gathered from various sources, including the subjects thereof, but neither *Who's Who in America* nor the *Information Please Almanac* can guarantee the accuracy of each individual item. We have learned to accept the date and place of birth that any lady or gentleman claims for herself or himself and not argue about it. Where we have not been able to learn the date and place of birth, we have not attempted to invent the items.

- VALENTINO**, Rudolph (Rodolpho d'Antongualla) (actor); b. Castellana, It. (1895-1926).
- VANDENBERG**, Arthur Hendrick (legislator); b. Grand Rapids, Mich. (1884-1951).
- VANDERBILT**, Cornelius (financier); b. Port Richmond, N. Y. (1794-1877).
- VANDYKE** (or **VAN DYCK**), Sir Anthony (painter); b. Antwerp, Hol. (1599-1641).
- VAN GOGH**, See Gogh.
- VELÁZQUEZ**, Diego Rodríguez de Silva y (painter); b. Seville, Sp. (1599-1660).
- VERDI**, Giuseppe (composer); b. Roncole, Parma, It. (1813-1901).
- VERMEER**, Jan (or Jan van der Meer van Delft) (painter); b. Delft, Hol. (1632-1675).
- VERNE**, Jules (author); b. Nantes, Fr. (1828-1905).
- VILLA**, Pancho (or Francisco) (Doroteo Arango) (bandit); b. Rio Grande, Mex. (1877-1923).
- VILLON**, François (François de Montcorbier) (poet); b. Paris, Fr. (1431-c.1463).
- VINCI**, Leonardo da (painter & scientist); b. Vinci, Tuscany, It. (1452-1519).
- VIRGIL** (or **VERGIL**) (Publius Vergilius Maro) (poet); b. Mantua, Gaul (70-19 B.C.).
- VOLTAIRE** (François Marie Arouet) (author); b. Paris, Fr. (1694-1778).
- VON STROHEIM**, Erich (actor); b. Vienna, Aus. (1885-1957).
- WAGNER**, Honus (John Peter Wagner) (baseball player); b. Mansfield, Pennsylvania (1874-1955).
- WAGNER**, Wilhelm Richard (composer); b. Leipzig, Ger. (1813-1883).
- WALTON**, Izaak (author); b. Stafford, Eng. (1593-1683).
- WARD**, Fannie (actress); b. St. Louis, Mo. (1872-1952).
- WASHINGTON**, Booker T. (educator); b. Franklin Co., Va. (1856-1915).
- WATSON**, Thomas John (industrialist); b. Campbell, N. Y. (1874-1956).
- WATT**, James (inventor); b. Greenock, Scot. (1736-1819).
- WAYNE**, Anthony (military officer); b. Waynesboro, Pa. (1745-1796).
- WEBER**, Karl Maria Friedrich Ernst von (composer); b. nr. Lübeck, Ger. (1786-1826).
- WEBSTER**, Daniel (statesman); b. Salisbury, N. H. (1782-1852).
- WEBSTER**, Noah (lexicographer); b. West Hartford, Conn. (1758-1843).
- WEILL**, Kurt (composer); b. Dessau, Ger. (1900-1950).
- WEIZMANN**, Chaim (Israeli statesman); b. Grodno prov., Rus. (1874-1952).
- WELLINGTON**, Duke of (Arthur Wellesley) (statesman); b. Ireland (1769-1852).
- WELLS**, Herbert George (author); b. Bromley, Kent, Eng. (1866-1946).
- WESLEY**, John (religious leader); b. Epworth Rectory, Lincolnshire, Eng. (1703-1791).
- WESTINGHOUSE**, George (inventor); b. Central Bridge, N. Y. (1846-1914).
- WHARTON**, Edith Newbold (nee Jones) (novelist); b. New York City (1862-1937).
- WHISTLER**, James Abbott McNeill (painter); b. Lowell, Mass. (1834-1903).
- WHITE**, William Allen (journalist); b. Emporia, Kans. (1868-1944).
- WHITMAN**, Walt (Walter) (poet); b. West Hills, N. Y. (1819-1892).
- WHITNEY**, Eli (inventor); b. Westboro, Mass. (1765-1825).
- WHITTIER**, John Greenleaf (poet); b. Haverhill, Mass. (1807-1892).
- WILDE**, Oscar (Oscar Fingal O'Flahertie Wills) (author); b. Dublin, Ire. (1854-1900).
- WILLIAMS**, Roger (clergyman); b. London, Eng. (1603?-1683).
- WILLKIE**, Wendell Lewis (lawyer); b. Elwood, Ind. (1892-1944).
- WINTHROP**, John (1st Gov., Mass. Bay Colony); b. Suffolk, Eng. (1588-1649).
- WISE**, Stephen Samuel (rabbi); b. Budapest, Hung. (1874-1949).
- WOLFE**, Thomas Clayton (novelist); b. Asheville, N. C. (1900-1938).
- WOLSEY**, Thomas (prelate & statesman); b. Ipswich, Eng. (1475?-1530).
- WOOD**, Grant (painter); b. Anamosa, Iowa (1892-1942).
- WOOLF**, Adeline Virginia (nee Stephens) (novelist); b. London, Eng. (1882-1941).

WOOLLCOTT, Alexander (author); b. Phalanx, N. J. (1887-1943).
 WORDSWORTH, William (poet); b. Cockermouth, Cumb., Eng. (1770-1850).
 WRIGHT, Orville (inventor); b. Dayton, Ohio (1871-1948).
 WRIGHT, Wilbur (inventor); b. Millville, Ind. (1867-1912).
 YEATS, William Butler (poet); b. nr. Dublin, Ire. (1865-1939).
 YOUNG, Brigham (religious leader); b. Whitingham, Vt. (1801-1877).

YOUNG, Cy (Denton True Young) (baseball player); b. Gilmore, Ohio (1867-1955).

ZAHARIAS, Mildred (Babe) Didrikson (athlete); b. Port Arthur, Tex. (1912-1956).
 ZIEGFELD, Florenz (theatrical producer); b. Chicago, Ill. (1869-1932).

ZOLA, Émile (novelist); b. Paris, Fr. (1840-1902).

ZOROASTER (or ZARATHUSTRA) (religious leader); b. Persia (lived about the 6th century B.C.).

American Academy of Arts and Letters

(633 W. 155th St., New York 32, N. Y.)

The American Academy of Arts and Letters was created as a section of the National Institute of Arts and Letters in 1904, and was incorporated by an Act of Congress signed by the President on Apr. 17, 1916. Its membership is limited to 50 persons chosen from

those who at any time have been on the list of membership of the Institute.

The object of the Academy is to give greater definiteness to the work of the Institute in furthering the interests of literature and the fine arts in the U. S.

Members of the Academy

Conrad Aiken
 Maxwell Anderson
 Wystan Hugh Auden
 Bernard Berenson
 Ernest Bloch
 Van Wyck Brooks
 Arthur Brown, Jr.
 Pearl S. Buck
 Gilmore D. Clarke
 Aaron Copland
 E. E. Cummings
 William Adams
 Delano
 John Dos Passos

Barry Faulkner
 William Faulkner
 Robert Frost
 John Hersey
 Charles Hopkinson
 Edward Hopper
 M. A. De Wolfe Howe
 Anna Hyatt Huntington
 Robinson Jeffers
 Leon Kroll
 Joseph Wood Krutch
 Lee Lawrie

Walter Lippmann
 Archibald MacLeish
 Paul Manchip
 Douglas Moore
 Marianne Craig Moore
 Lewis Mumford
 Allan Nevins
 Frederick Law Olmsted
 Walter Pliston
 Edward W. Redfield
 Carl Sandburg
 Henry D. Sedgwick

Roger Sessions
 Henry R. Shepley
 Eugene Spelcher
 John E. Steinbeck
 Igor Stravinsky
 Deems Taylor
 Chauncey Brewster Tinker
 Mark Van Doren
 Thornton Wilder
 Frank Lloyd Wright
 Andrew Wyeth
 Mahonri M. Young

Honorary Members of the Academy-Institute

Germán Arciniegas
 Benjamin Britten
 Georges Braque
 André Chevrillon
 Jean Cocteau
 Isak Dinesen
 André Dunoyer de Segonzac
 T. S. Eliot
 Sir Jacob Epstein
 E. M. Forster
 Romulo Gallegos

Hu Shih
 Augustus E. John
 Charles Edouard J. Le Corbusier
 G. Francesco Malipiero
 André Malraux
 Jacques Maritain
 John Masefield
 W. Somerset Maugham

Gian-Carlo Menotti
 Darius Milhaud
 Jawaharlal Nehru
 Pier Luigi Nervi
 Diego Rivera
 Jules Romains
 Bertrand Russell
 José Luis Zorilla de San Martín
 Henri Sauguet
 Albert Schweitzer

Ignazio Silone
 Edith Sitwell
 Sir Osbert Sitwell
 H. M. Tomlinson
 Arnold J. Toynbee
 George Macaulay Trevelyan
 Ralph Vaughan Williams
 Heitor Villa-Lobos

National Institute of Arts and Letters

(633 W. 155th St., New York 32, N. Y.)

The National Institute of Arts and Letters was founded in 1898 by the American Social Science Association and was incorporated by an Act of Congress signed by the President on Feb. 4, 1913, for the furtherance of literature and the fine arts in the U. S. Its membership is limited to 250 native or natural-

ized citizens qualified by notable achievements in art, literature or music. It confers certain awards and honors for work of distinction; and, together with its affiliate, the American Academy of Arts and Letters, it elects as honorary members many distinguished artists from other countries.

An exhibition of the works of newly elected members and recipients of honors is held every spring, and other art, book and manu-

script exhibitions from time to time during the year. A concert of works by recipients of grants in music is given annually.

Members of the Institute

Dept. of Literature
 Franklin P. Adams
 Léonie Adams
 Conrad Aiken

CONTRACT BRIDGE

By B. JAY BECKER

Top Record-Holder in Masters' Individual Championship Play

Contract bridge was invented by Harold S. Vanderbilt in 1925. The new game was a great improvement over the parent game, auction bridge, which in turn had been derived from whist, a card game of two centuries standing.

Contract bridge developed rapidly but did not catch fire with the public until the late Ely Culbertson, a promotion genius of the first order, staged a simulated grudge match against Sidney Lenz in 1931. Newspapers everywhere carried daily stories on the hectic match refereed by Lieutenant (now General) Alfred M. Gruenther.

Various systems of bidding sprang up during the first years of contract bridge but after five or six years of experimentation the best features of each were joined to form what is essentially the system in use today. Among the leading contributors to the evolution of present day methods were Vanderbilt, Culbertson, Lenz, Work, Whitehead, Reith, Goren, Blackwood, Roth, Stayman.

Today, bridge is regarded as almost a social necessity. Hundreds of textbooks have been written and many newspapers carry daily bridge columns. It is estimated there are 25 million bridge players in the United States. Sectional, national and international tournaments are conducted by the American Contract Bridge League, governing body of bridge.

EVALUATION

For many years, the chief method of determining the value of a hand was by means of a scale called honor tricks. Culbertson was chief proponent of this method. High cards are, for example, valued as follows:

A = 1 H. T.	K-x = $\frac{1}{2}$ H. T.
K-Q = 1 H. T.	Q-J-x = $\frac{1}{2}$ H. T.
A-K = 2 H. T.	Q or J = plus value
A-Q = $\frac{1}{2}$ H. T.	

During the past ten years the honor trick method has been largely supplanted by the point count method. Point count was devised by Milton Work back in the auction days, but was not generally accepted until Charles H. Goren took a prominent part in bringing it to the attention of the public. The experts had played point count for years, but to the lesser players it was relatively unknown. The introduction of point count has done a great deal to raise the level of bidding skill for the average player.

Point count evaluation divides into two categories: high card points and distributional points. With balanced hands—hands without a void or singleton—the high card point count is both practical and accurate and reflects essentially the true value of a hand.

HIGH CARD POINTS

Ace = 4 points	Queen = 2 points
King = 3 points	Jack = 1 point
Total points in deck	= 40
Points in each suit	= 10
Points in average hand	= 10
Points required for game	= 26
Points required for small slam	= 33
Points required for grand slam	= 37

Opening notrump bids are characterized by distribution which is usually 4-3-3-3, 4-4-3-2, or in some cases 5-3-3-2 and strength or stoppers in all four suits. The required point count is:

Opening 1 N. T. = 16 to 18 points
Opening 2 N. T. = 22 to 24 points
Opening 3 N. T. = 25 to 27 points

With 19, 20 or 21 points, bid one of a suit and jump in notrump over partner's response. Responses to an opening one notrump bid, with a balanced hand:

Raise 1 N. T. to 2 N. T. with 8 or 9 points
Raise 1 N. T. to 3 N. T. with 10 to 14 points
Raise 1 N. T. to 6 N. T. with 17 to 20 points
Raise 1 N. T. to 7 N. T. with 21 points or more

DISTRIBUTIONAL POINT COUNT

Two methods of evaluating distributional points are in general use. According to the Goren method 3 points are taken for each void, 2 points for each singleton and 1 point for each doubleton. These are added to the high card point count to determine the value of the hand.

According to the Karpin method 1 point is taken for each card in a suit above four. These points are then added to the high card points to determine the value of the hand.

As new information is obtained during the bidding, the original distributional point count evaluation may rise or fall. Distributional point count should not be rigidly followed. It is a flexible yardstick.

OPENING SUIT BIDS

The opening bid of one in a suit ranges usually from 12 to 21 points. All hands containing 14 high card points are compulsory opening bids. Distributional factors are important in evaluating a hand. Distribution is a key factor in every deal.

In choosing the suit with which to open the bidding, the longest suit is usually bid first. When two suits are of equal length the higher ranking suit is generally bid first. When there are three biddable four-card suits the suit that is chosen is the one directly beneath the singleton in rank.

RESPONSES TO SUIT BIDS

Any new suit named by the responding hand compels the opening bidder to bid

again. With 6 points or more the partner of the opening bidder of one in a suit must make a response. He may name a new suit, respond in notrump or raise the opening bidder's suit.

The single raise of the opening bidder's suit denotes adequate trump support and 6 to 9 points which include distributional values. The response of one notrump denotes a balanced hand without adequate trump support with 6 to 9 points in high cards. The response of one of a new suit denotes 6 to 16 points. The response of two in a new suit denotes 10 to 16 points.

The jump raise of the opening bidder's suit, for example 1 spade—3 spades, denotes at least four trumps and 13 to 15 points. The response of 2 notrump to the opening bid of one in a suit denies adequate trump support and represents a balanced hand with 13 to 15 points in high cards, plus stoppers in the remaining three suits. The response of 3 notrump indicates 16 to 18 points and a balanced hand with stoppers in the other three suits.

BIDDABLE SUITS

Any five card suit is biddable. Any four card suit which includes four high card points is biddable.

REBIDS BY OPENING BIDDER

Having opened with one of a suit the opening bidder may identify a minimum type of hand by rebidding one notrump or by repeating his previous suit in minimum terms. A rebid by the opening bidder, where he goes one level higher than necessary, represents a strong hand containing at least 17 points.

OPENING BID OF TWO IN A SUIT

This bid is forcing to game. It represents a hand which for practical purposes can make a game by itself. The best method in use to determine whether a hand ranks as a two bid is to count the losers, and if the hand then contains enough winners to insure a game the hand qualifies as a two bid. The response to a two bid is 2 notrump unless the responder has more than 6 points in which case he either raises his partner, bids his own suit or jumps in notrump.

OVERCALLS

The bid over an adverse opening bid, when made in the one level, usually ranges in high cards between 7 and 13 points and includes a good suit. The overcall in the two level is made with a strong suit and usually has about 12 or 13 points in high cards. In making overcalls, the number of winning tricks which are probable is more important than the point count. The overcaller should not be subject to a penalty in excess of 500 points in the event he should be doubled. The informatory double over an adverse opening bid represents at least an opening bid of its own.

BLACKWOOD SLAM CONVENTION

After the partners have agreed definitely or inferentially upon a suit as trump the bid of 4 notrump by either of them is an artificial bid requesting partner to name the number of Aces he has. The responses are as follows:

- No Aces — 5 Clubs
- 1 Ace — 5 Diamonds
- 2 Aces — 5 Hearts
- 3 Aces — 5 Spades
- 4 Aces — 5 Notrump

When the response is followed by a 5 notrump bid it should be construed as a request for the number of Kings. The responses are as follows:

- No Kings — 6 Clubs
- 1 King — 6 Diamonds
- 2 Kings — 6 Hearts
- 3 Kings — 6 Spades
- 4 Kings — 6 Notrump

STAYMAN NOTRUMP CONVENTION

The response of 2 Clubs to partner's opening one notrump bid is an artificial bid requesting the opener to bid a four card major suit. If the opening bidder has no four card major he replies by bidding 2 diamonds with a minimum one notrump bid, or 2 notrump with a maximum notrump bid.

IN GENERAL

Bridge is a partnership game. In bidding, each player tries to represent to his partner the strength or weakness of his hand. Exact bidding will produce exact results. Weak hands are bid weakly; strong hands are bid strongly. Forcing bids must be respected. Partners' bids should be trusted more than the opponents' bids.

High card point count in balanced hands is very accurate. Distributional point count is sometimes treacherous and common sense should be employed where the distributional point count does not appear to give an accurate evaluation of the true value of the hand.

In counting defensive tricks against a suit contract, honor tricks provide a more reliable gauge than point count.

Remember that the important thing in bridge is the number of tricks that are taken, not the number of points a side has. Remember also that all the rules in bridge are made to be broken at the appropriate time. There is no such word as "never" when it comes to stating a general principle. You can be dealt 635,013,559,600 different hands in bridge. No general rules can be expected to cover all possibilities. Imagination and ingenuity are important qualities to be exercised.

Large penalties should be avoided. A game should not be bid unless there is nearly an even chance of making it; a small slam should not be bid unless there is an even chance at least to make it; a grand slam should not be bid unless there is at least a 2 to 1 probability of making it. Play probabilities, and not hunches. Bridge is a scientific game.

PARLIAMENTARY PROCEDURE

by

Dan Golenpaul

Parliamentary procedures are rules for the conduct of a meeting in an orderly and democratic manner. Their purpose is to ensure the rule by a majority and to protect the rights of all members of an organization or assembly in meetings and in connection with all activities of the organization. The application of parliamentary rules is solely for this purpose.

Very often, though, individuals employ the rules for a contest of wits. This practice can be interesting and the life of the meeting, but it can also be a nuisance and a field day for parliamentary pests. The degree to which this activity may be tolerated should be dictated by circumstances. A certain amount of indulgence may be necessary because it is part of the game and is inevitably an expression of many egos that meet in a group.

Under no circumstances, however, should a chairman or members permit anyone to use the rules of procedure to trick and confuse members or to impede the function of a meeting. To prevent these occurrences, a knowledge of parliamentary rules is important. We will do our best in the limited space permitted to impart a little learning. (But remember, a little learning is a dangerous thing.) What we are setting forth here should be adequate to take care of most situations in organizations made up of friendly people who want to conduct their business in an orderly, friendly manner.

If it is necessary for you to be a member of a group that is involved in bitter conflicts, then we advise that you go to more technical and authoritative works on parliamentary procedure such as *Robert's Rules of Order*, *Cushing's Manual*, *Sturgis' Standard Code of Parliamentary Procedure* and others. We also suggest that you go to the meetings with a good lawyer and a baseball bat.

HOW TO FORM AN ORGANIZATION

People form or join organizations because they have a common interest or purpose that can best be advanced and attained through group activity. Whether the character of the organization be social, political, educational, communal, fraternal or athletic, its purpose and government are usually expressed in by-laws. They are not required to be elaborate, technical or legal.

BY-LAWS

By-laws should simply state the objects of the organization, the rights and duties of members, the qualifications of members, the number required to constitute a quorum, the dues, the necessary governing officers and how they should be elected, their terms of office, when meetings should be held and where, the order of business and, in the case of large and impersonal organizations, an authority for settling parliamentary disputes. (An organization usually adopts as its guide such works as mentioned heretofore.)

FIRST MEETING

At the first meeting of a group, temporary officers are chosen: a chairman, a secretary and a committee to prepare a draft of by-laws. The meeting is called to order by the member of the group who has assumed the leadership in the formation of the organization. He or she opens the meeting by the simple statement: "I now call the meeting to order," and asks the members to make nominations for chairman. When this announcement is made, members may ask for the floor by raising their hands, and, when recognized, offer a name in nomination. The person presiding can be nominated as can any other member present. Nominations require no seconding. A majority vote is necessary for the election of the chairman. The same procedure is required for the secretary and committee on by-laws.

The officers selected at the first meeting may serve until the next meeting or for a limited period, to be decided by a majority vote of the members present.

SECOND MEETING

At the second meeting, the report of the committee on by-laws is presented to the membership. The entire report may be accepted by a motion to adopt the report. A two-thirds vote is required. If the entire report is not acceptable to the membership, each provision may be considered separately; consideration consists of debating, amending, accepting or rejecting. The vote required on each provision is two-thirds of the membership present instead of the usual majority. Because by-laws are the fundamental basis of the organization, they should be acceptable to as many members as possible.

By-laws can be amended at any time during the life of the organization. Any proposals for changes in the by-laws require prior notice in writing to the entire membership before acting upon the proposed amendments at any meeting.

ELECTION OF OFFICERS

With the adoption of the by-laws providing for the type of officers for the organization, and the length of their terms, the organization proceeds to elect such officers. The usual officers for most groups are a president, vice-president, recording secretary, corresponding secretary, treasurer, sergeant at arms, and committees. Some have an executive secretary, a paid job, but an organization would have to be large to warrant a paid official.

All members are eligible for office when an organization is first formed. But later the by-laws may require a certain minimum period of membership as a qualification to hold office. Nominations are made by the simple statement: "I nominate so-and-so." The nominations do not require a second and a majority vote is necessary for election.

DUTIES OF OFFICERS

President: The president, as in government, is top man in an organization. Some organizations call this official "chairman." President sounds better, and is more appropriate when he performs not only the functions of presiding at meetings, but other duties in directing the organization. Chairman is the proper designation for one elected only to preside at a meeting.

Their duties as presiding officers are identical, regardless of title; they call the meeting to order, then present the order of business which the meeting is to act upon. They recognize members who desire the floor for a proposal or a discussion. They are supposed to see that everyone who wishes to speak has the opportunity, and to do as little talking themselves as possible. The presiding officer has the right to take part in a discussion. When he does, the vice-chairman should take the chair until the presiding officer has concluded his talk.

A chairman is really a moderator who directs, controls and regulates proceedings. He is neither a boss nor an antagonist and is not to be regarded as such by the members. It is the chairman's primary job to keep the meetings moving smoothly. He should prevent members from abusing their privileges without interference, but should not curb their rights. The chair must entertain all motions that are seconded and must restate them for the members. He must call for a vote on motions and declare the motion adopted or defeated on the basis of the vote. He should allow for a re-count or a roll call whenever requested to do so. When referring to himself, the presiding officer usually says: "The chair recognizes Mr. Blank" instead of "I recognize Mr. Blank."

The president or permanent chairman is usually an ex-officio member of all committees. Although he is not obligated to attend all meetings, he may if he so desires.

Secretary: The duties of a secretary are to keep the records of the organization, to record the minutes of the meetings, to handle the correspondence (unless the organization is large enough to require a corresponding secretary), such as notifying members of regular meetings or of a special meeting, reading the minutes at the meeting, etc.

The minutes of a secretary should indicate when the meeting was held, where it took place, who presided, what business was transacted, when the meeting adjourned, etc.

Treasurer: The treasurer's duties are to handle the funds of the organization, to collect the dues, to pay the bills when

authorized, to keep the books for the organization with records of income and expenditures, and to render reports on finances at the regular meetings.

Sergeant-at-Arms: The duties of the sergeant-at-arms are to assist the chairman in preserving order among the people present at a meeting, members and visitors, to act as a sort of usher by checking people at the door to see that only those entitled to be present at the meeting are admitted, and to escort anyone out if requested to do so by the chairman.

COMMITTEES

The purpose of committees is to expedite the transaction of business on matters that require more time than the meeting permits, or on matters that require time for investigation and special study. Committees are essential in a large organization, but are really not necessary for a small group that can handle its limited business at the regular membership meetings.

The types of committee may vary according to the needs of an organization. A "standing" committee has a fixed term of office and gives continuous service. A "special" committee serves temporarily to investigate and report on some special project or condition.

The top committee in most organizations is the executive committee, sometimes made up of the chairmen of the various committees, sometimes selected from the general membership. Other committees are: membership committees, athletic committees, education committees, social or house committees, committees on finance, temporary committees to deal with a temporary specific problem, etc.

Committees may be appointed by the presiding officer, or be elected by the group, depending upon the by-laws. We think it best for committees to be elected by the membership. The chairman of the committee is either designated by the presiding officer, elected by the committee, or is the person obtaining the most votes in the election. Committees should consist of an odd number of members to assure a majority vote and a minimum of stalemates. As far as possible, the by-laws governing

the conduct of a meeting or organization govern the committees as well.

Most committees are usually made up of small groups and, therefore, their meetings are less formal than regular organization meetings. Motions do not require seconding, speeches are not as restricted and limited, and the chairman attending the committee, or the president of the organization, if attending the committee meeting, participates in the discussions on a par with the other members.

Providing for numerous officers is a good thing because it distributes responsibility among more members. This is important to keep in mind in connection with committees; while good people should be placed on many committees, it is best and advisable to have as many members on committees as possible.

The committee chairman reports for the committee to the general membership meeting. Reports of the committee may consist only of information requiring no action or may contain recommendations for certain action which is often the equivalent of a proposed motion.

When there is a difference of opinion among committee members, the majority report offered is considered the committee report. The dissenting members have the right, however, to submit a minority report proposing a different course of action. Both reports must be heard or read at the same meeting. No action on the majority report is in order until the minority report is disposed of. It can be disposed of in either of two ways. (a) Any member may object to consideration of the minority report and such objection must be voted on immediately without debate. If carried, the minority report is dropped. (b) If the objection to consideration is not upheld, then a motion to substitute the minority report for the majority report is in order. If this motion is carried, the majority report is eliminated and the minority report becomes the committee report and is the only report before the body. If the motion to substitute is not carried, then the meeting proceeds to deal with the majority report.

It is well to bear in mind that any report or motion belongs to the membership.

If they are not satisfied with either report, they can dissolve the committee and act directly from the floor or appoint a new committee.

The chairman of the committee calls the meetings of the committee. If he fails or refuses to do so, or if he is absent, any two members of the committee may call a meeting. The chairman of a committee usually acts as its secretary.

If a committee fails to render a report on a matter referred to it within a reasonable time, the membership may force it to do so by drawing up a petition bearing the number of signatures required in the by-laws. This is called discharging a committee.

ORDER OF BUSINESS

The chairman calls the meeting to order. He must determine whether a quorum is present. The number of members required to constitute a quorum is stipulated in the by-laws, usually one more than half of the membership, or as low as one-tenth of the membership. Without a quorum, business cannot be legally conducted. The secretary reads the minutes of the previous meeting and they are adopted, perhaps with corrections, or, as read. Officers and committees make any reports they have. Old business left over from the previous meeting is transacted. New business is brought up, discussed and acted upon. At the close, the chairman says that he will entertain a motion for adjournment.

RULES OF DEBATE

The presiding officers should first recognize the mover of a proposal, or the member of a committee presenting a report, and should try to alternate recognition between those favoring and those opposing a proposition. Any member is entitled to speak on the main question and on each amendment as presented. He must confine himself to the question under consideration, must avoid personalities, and must not accuse others of ill motives. In some groups the by-laws limit each speaker to a fixed number of minutes. The meeting may vote to extend the time of a speaker if it so desires. Debate can only be halted by a motion for the previous question and a two-thirds vote is required.

VOTING RULES

There are several methods of taking a vote. The simplest is by voice—"ayes" and "noes." This may be challenged by any member who thinks that the chairman did not hear correctly, in which case the vote is taken by a show of hands, or by standing. Roll call votes, recorded by the secretary, are required in some instances. The closed ballot (written votes) also is commonly used, especially in the election of officers. Only attending members may vote, unless the by-laws specifically permit proxy voting. A tie vote defeats a motion. The chairman is allowed to break a tie, though, if he has not previously voted. Some organizations permit a chairman to vote only in case of a tie, while others allow him to vote as a regular member.

A majority vote is generally required to pass ordinary motions or to adopt ordinary actions. There are certain motions which require a two-thirds vote of those present. These generally include the following: amendments to the by-laws, to take up a question out of its proper order, to suspend the rules, to support an objection to the consideration of a question, to take up the previous question, to limit debate, to expel a member or officer, to discharge a committee, or to refer back to a committee. No vote can be made unanimous if even one member present objects.

WHAT HAPPENS TO A MOTION

A motion is a proposal for action by an organization. It is made by any member who asks the chair for the floor and is properly recognized. Most motions require a second before being placed before the group. Not more than one main motion may be considered at a time. The procedure is simple. One merely says, "I move the following." The chairman then asks if anyone seconds the motion. If it is properly seconded, the chairman announces that a motion has been made and seconded, calls for a discussion and repeats the motion on request. A motion may be voted on without discussion, but discussion is required if requested by any member.

A motion causes many things to happen. It provokes debate, suggests modifications,

clarifies the thinking and expresses the will of the group on a question. Once a motion is presented to the membership, it belongs to them to treat and dispose of in any one of several ways and can only be withdrawn with the consent of the membership.

A motion may be amended. This means that the motion may be modified or qualified by adding, substituting, or eliminating words or whole paragraphs. These changes must be relevant to the main motion.

For example, a motion is made for the organization to publish a magazine and stipulates (a) the publication to be a monthly, (b) to have two editors, (c) to cost the members \$1.00 a year, etc. This motion may be amended as follows: (a) to substitute "weekly" for "monthly," (b) to provide salaries for the two editors, (c) to eliminate the dollar charge for the magazine. All these amendments are in order because while the original motion has been amplified or qualified by the amendments, the proposal for publishing a magazine still prevails.

Amendments that are irrelevant are not permissible, such as an amendment requiring the editors to watch television. This is improper (perhaps for other reasons) because it is extraneous to the main question of proposing the publication of a magazine.

Amendments that negate the purpose of the motion, such as a proposal that the organization should not publish a magazine, are out of order because if the membership is entirely opposed to the idea, it can vote against the main motion or dismiss it in other parliamentary ways.

Other important rules governing amendments are:

1. There is no limit to the number of amendments that may be offered, but each amendment must be disposed of before a new one may be proposed.

2. After all amendments have been acted on, the meeting votes on the main motion, and all of the adopted amendments are incorporated in the main motion.

3. All amendments require a majority vote for passage.

4. A rejected amendment may not be re-submitted in identical form and no amend-

ment may be offered reversing an amendment previously adopted.

This is not all that can happen to a motion. In addition to amendments to the motion, you are also permitted to make amendments to the amendments. For example, the original motion stipulates that the magazine should have two editors. An amendment provides that the editors be paid salaries. This amendment can be amended to provide what the salary should be.

Now, if you are thinking of whether you can amend the amendment to the amendment, the answer is "No." Although this has really gone far enough, there is something else you are allowed to do, for better or worse, and that is to introduce a substitute for the motion itself or for any of the amendments or for everything that has been proposed on the question. The substitute for an amendment does not modify the amendment, but replaces it and is subject to the same rules that apply to amendments.

When amendments pile up to the point of confusing the membership, resorting to a substitute for the entire proposition may be helpful. The best way to do this, under the circumstances, is for someone to move to have a special committee designated to prepare a substitute motion for the whole.

If the motion is adopted, the committee-elect should withdraw from the meeting to try to reconcile any contradictions contained in the motion or the amendments. It should bring forth a clear substitute that expresses the intentions of most of the proposals.

Let us not lose sight of the fact that the purpose of a motion is not to create an endless chain of acts, but to get something done. In this connection, it is well to bear in mind that the motion and amendments do not necessarily conflict and that the proposer of a motion may accept the amendments without discussion or vote.

Motions that cannot be amended: These include such motions as questions of order or appeal, objections to consideration of the question, or motions to adjourn, to call for the order of the day, to vote, to withdraw a motion, to take up a question out

of proper order, to suspend the rules, to table, to take from the table, to reconsider, to consider the previous question, to postpone indefinitely, to amend an amendment, or to nominate. Motions to postpone indefinitely, to limit debate, or to recess can be amended as to time only.

DELAYING OR CANCELING CONSIDERATION OF A MOTION

It is not binding on a meeting to deal with a motion at the time it is proposed. On the contrary, the membership has the choice of postponing or renewing consideration of a motion. Here are some of the ways to attain such objectives.

Objection to consideration: Consideration of any issue may be stopped before discussion begins on the question, even though it involves interrupting the speaker, by objecting to its consideration. This objection may be made by any member and does not require a second. Objection to consideration calls for an immediate vote without debate or amendment and requires a two-thirds vote. If carried, the motion is dropped for all time. The purpose of the act is to prevent the meeting from dealing with a question that may be offensive. This reason should be primary. Other reasons may be because it might waste the time of the meeting or it may be inappropriate to deal with the question at the time. This action is very drastic and should not be employed to gag any member except the village idiot at his worst.

Motion to postpone indefinitely: This is a polite way of killing a motion, at least for the moment. It differs from "Objection to consideration" insofar as the motion to postpone indefinitely and the motion itself are debatable and cannot be made while a member has the floor. This motion requires a second and calls for a majority vote. It cannot be amended and cannot be brought up again.

Motion to "lay on the table": If the meeting does not want to consider the motion at all, the procedure is to make a motion to "lay the question on the table." This suspends consideration of the main motion and amendments until such time

as the group chooses to take it up again, which can be later at the same meeting after other business has been transacted or at any subsequent meeting. This motion must be seconded, requires a majority vote, may not be debated or amended or postponed. The only way to bring the motion back is to move to "take it off the table."

Motion to postpone to a definite date: This is an expression of the will of the meeting to put off consideration of the proposal until later in the same session or until a subsequent meeting. The object of such an act is to delay consideration of the question until more members are present, or to enable members to acquire further information before making their decisions. This motion is debatable only as to the advisability of postponement. The subject matter of the motion is not debatable. It is open for amendment as to time only and requires a majority vote.

Motion to refer to a committee: This is usually done if a meeting feels that a question requires more time and information before it acts upon it. A motion to refer to a committee names an existing committee or creates a special committee for its consideration and may be accompanied by instructions. Seconding and a majority vote are required for passage of this motion. It can be debated only as to the desirability and advisability of referring it to the committee. It can be amended only as to the nature of the committee and as to the instructions.

HOW TO REOPEN A QUESTION

To avoid finality of decisions that may be harmful to the best interests of the members, certain actions previously taken by the members are subject to review by them. Such review may apply to matters acted upon, matters postponed, or matters delegated to committees.

Motion to reconsider: This deals with something acted upon by a meeting which the members would like to reconsider at another time during the same meeting. It is a motion that should be made by one who has voted with the majority, whether in the affirmative or the negative, and is

made because the voter has changed his mind on the matter in the light of new information. Very often a member deliberately votes for or against motions so that he can move for reconsideration of the subject later in the meeting when there may be a better chance for passing or defeating the motion because more members are present or because he will have an opportunity to persuade other members to change their votes. This is both good parliamentary procedure and democratic.

A motion to reconsider requires a second, a majority vote, is debatable and cannot be renewed. If a motion to reconsider is carried, the question is before the assembly with its original parliamentary status. Motions that cannot be reconsidered include: motions to take from the table, to lay on the table, or a motion for indefinite postponement that has been defeated.

To take from the table: This motion allows a group to take up a subject that was set aside by a motion to table it at a previous meeting. This resumption of consideration on a question rates priority over any new motions and can be introduced when there is no other business before the body. Motion to take a question from the table requires a second and a majority vote, is not debatable and cannot be amended.

A motion to rescind: This motion enables the membership to re-evaluate some action taken in the past because it may have been adopted without full understanding of the consequences at that time. The point of rescinding a previous act of an organization does not apply to any legally binding act committing the organization, nor to the election of members or officers. This motion calls for a second and majority vote unless the original motion involved required a two-thirds vote. It is debatable and cannot be amended.

Several important techniques for keeping informed about proceedings, preventing violations and protecting the rights of members, correcting errors, and expediting the business at hand, are:

Moving the Previous Question: This asks that the discussion be stopped at once on any motion before the body. A move for the previous question cannot interrupt the speaker. It requires a second, is not de-

batable, cannot be amended, and requires a two-thirds vote. Its purpose is to say "Let's stop talking and vote."

Point of Information: This is a method of obtaining information about what is occurring through the medium of the chairman or the speaker. This interruption request is permissible even when one is speaking. It is unusual for the speaker or the chair to ignore such a request. Since it is intended only to secure information, it is not proper to use this as a device to make a statement or delay proceedings.

Point of Order: This questions the correctness of any action at the time it occurs. The only time that a point of order can be employed *after* an action has taken place, is if it involves a violation of by-laws, constitution, or the law. It is raised on the basis of a mistake or omission in procedure, of a violation of the rules of the organization, of decorum in debate, or of irrelevancy of debate and procedure. A point of order needs no seconding, cannot be amended and requires no vote.

A point of order may be raised by any member at any time. It is in the nature of a demand addressed to the chair, which is required to act immediately on the point of order raised. The procedure is as follows: A member announces, "I rise to a point of order." This automatically halts any discussion or action until the chairman rules on the point of order. If the chairman concurs, he announces that the point of order was well taken, and proceeds to correct whatever is in question.

Appeal: If any other member takes exception to this ruling, he may appeal from the decision of the chair. Another basis for an appeal may result when the chair declares the point of order not well taken. This appeal is usually made by the person raising the point of order. All appeals require a second, are debatable and are subject to a majority vote of the membership. If they vote for the appeal, the chairman's decision is reversed. If they vote against the appeal, the chairman's decision is upheld. In the event of a tie vote, the chairman is sustained. If the chairman is a member of the organization, he has the right to vote and may make the tie.

Discussions on some appeals are not customary, such as questions of indecorum, violation of rules of speaking, or order of business.

Sometimes the chairman is in doubt on a point of order. When he is, he may defer to someone present for advice, or ask the members to discuss and vote on the point of order. This is the only time that a point of order is debatable. Their vote determines the chairman's decision.

Motion to adjourn: This motion is in order at any time, but should be employed with discretion. Obviously, it should not interfere with the organization's efforts to get business done. This motion requires a second, is not debatable, cannot be amended, and must be voted on immediately. A majority vote is necessary. Any motion for adjournment that refers to a specific time or place for the next meeting is subject to debate and amendment.

We have tried to project the reader into actual participation in the forming of an organization and the conduct of a meeting, and we have given more attention to the processes than to the discussion of technical rules. In following this course, we may have omitted some matters that do not occur at every meeting, but that do happen occasionally and should be understood.

Removal of officers: This is sometimes an unhappy necessity. Misconduct of an officer may involve neglect of duties, abuse of privileges or incompetence. The removal of an officer is accomplished by preferring charges which should be of a serious nature and supported by proof. The charges may be considered at a general meeting or referred to a committee to investigate and to recommend a course of action. A two-thirds vote of the members present is required to remove an officer. A motion to remove an officer is debatable.

Expulsion of members: If a member violates his obligations and duties or is involved in an act that may bring disrepute to the organization, he is subject to charges and a hearing before a committee or the membership and can be expelled by a two-thirds vote. This action is debatable. Obviously, such actions should not be undertaken unless the charges are serious and

supported by substantial proof. It would be deplorable if the exercise of such a drastic action were based on a frivolous issue or personal bias. Sometimes the behavior of a member at a meeting requires disciplinary action in the form of a motion for immediate expulsion. This is not debatable and requires a two-thirds vote.

Question of privilege: A member may interrupt a meeting at any time to raise a question involving the comfort or convenience of the membership. It may concern such matters as the physical condition of the meeting hall, the seating of the members, the conduct of persons present, or the ability to hear speakers. This request requires no second, is not debatable, cannot be amended and is decided by the chair.

Suspension of the rules: The object of a proposal to suspend the rules is to permit a meeting to do something that is ordinarily prohibited by the rules of parliamentary procedure or by the adopted order of business. The suspension of rules is generally employed to deal with an emergency or special condition, such as permitting a guest speaker to start earlier than scheduled or allowing for the interruption of the regular order of business by a visiting committee. There are other circumstances under which the suspension of rules is permitted, but these cases are too complicated to be treated here. This motion cannot interrupt a speaker, requires a second, cannot be debated or amended, and requires a two-thirds vote.

We have endeavored to outline some of the basic rules for the benefit of the many people who want some simple knowledge of how to form an organization, how to conduct a meeting, or how to participate in one; also to help spectators at a convention understand what is going on. Beyond this, we refer you to the authorities on parliamentary procedure.

However important rules are for guidance in most human activities, there is no doubt that much is accomplished through informal discussion and action, and we do not hesitate to urge small friendly groups to do their business with as little formality and as few restrictions as possible. If this does not always work, we hope our book is there to serve you.

CROSSWORD PUZZLE GUIDE

Since most persons who can read and write occasionally or frequently indulge in the indoor pastime of working crossword puzzles, this section is offered as a handy help to solvers who may be stumped for a two-letter word meaning "three-toed sloth" or a three-letter word meaning "native of Mindanao."

We have those two words here, and plenty more. We have the Greek, Roman, Norse and Egyptian deities of myth and legend. And we have those "Greek letters" and "months of the Jewish year" so often needed to fill out little gaps.

The reader is warned that in mythology there are many confusing and even conflicting accounts of the identities and adventures of the various gods, goddesses and lesser figures. There is also considerable variation in the spelling of names, places and things. For instance, you may spell it ICON, IKON or EIKON, and similar options are plentiful all along the crossword line. If the reader will keep further possible variations in mind, it may help at a critical point.

Various other sections of our book will be found of use to the crossword puzzler—especially the section of world geography and statistics which begins on page 727.

First Aid to Crossword Puzzlers

(We cannot, of course, begin to list all the odd words you will meet with in your daily and Sunday crossword puzzles, for such words run into many thousands. But we have tried to include those which turn up most frequently, as well as many others which should be of help to you when you are unable to go any further.)

Also, we do not guarantee that the definitions in your puzzle will be exactly the same as ours, although we have checked every word with a standard dictionary and have followed its definition.

In nearly every case, we have used as the key word the principal noun of the definition, rather than any adjective, adjective phrase, or noun used as an adjective. And, to simplify your searching, we have grouped the words according to the number of spaces you have to fill.)

 conquered.

Greek and Roman Mythology

(Most of the Greek deities were adopted by the Romans, although in many cases there was a change of name. In the list below, information is given under the Greek name; the name in parentheses is the Latin equivalent. However, all Latin names are listed with cross references to the Greek ones. In addition, there are several deities which were exclusively Roman.)

- ACHERON:** *See* Rivers.
- ACHILLES:** Greek warrior; slew Hector at Troy; slain by Paris, who wounded him in his vulnerable heel.
- ACTAEON:** Hunter; surprised Artemis bathing; changed by her to stag and killed by his dogs.
- ADMETUS:** King of Thessaly; his wife, Alcestis, offered to die in his place.
- ADONIS:** Beautiful youth loved by Aphrodite.
- AEACUS:** One of three judges of dead in Hades; son of Zeus.

JORMUNREK: Slayer of Swanhild; slain by sons of Gudrun.

JOTUNNHEIM (Jotunheim): Abode of giants.

LIF and **LIFTHRASIR**: First man and woman after Ragnarok.

LOKI: God of evil and mischief; instigator of Balder's death.

LOTHUR (Lodur): One of creators of Ask and Embla.

MIDGARD (Midgarth): Abode of mankind; the earth.

MIDGARD SERPENT: Sea monster; offspring of Loki; slays, and is slain by, Thor at Ragnarok.

MIMIR: Giant; guardian of well in Jotunheim at root of Yggdrasill; knower of past and future.

MJOLLNIR: Magic hammer of Thor.

NAGLFAR: Ship to be used by giants in attacking Asgard at Ragnarok; built from nails of dead men.

NANNA: Wife of Balder.

NIBELUNGS: Dwellers in northern kingdom ruled by Giuki.

NIFLHEIM (Nifelheim): Outer region of cold and darkness; abode of Hel.

NJORTH: Father of Frey and Freya; originally one of Vanir.

NORNS: Demigoddesses of fate: Urth (Urdur) (Past), Verthandi (Verdandi) (Present), Skuld (Future).

ODIN (Othin): Head of Aesir; creator of world with Vili and Ve; equivalent to Woden (Wodan, Wotan) in Teutonic mythology.

OTTER: Son of Rodmar; slain by Loki; his skin filled with gold hoard of Andvari to appease Rodmar.

RAGNAROK: Final destruction of present world in battle between gods and giants; some minor gods will survive, and Lif and Lifthrasir will repeople world.

REGIN: Blacksmith; son of Rodmar; foster-father of Sigurd.

REKIR: King of Huns; son of Sigl.

RODMAR: Father of Regin, Otter, and Fafnir; demanded Otter's skin be filled with gold; slain by Fafnir, who stole gold.

SIF: Wife of Thor.

SIGGEIR: King of Goths; husband of Signy; he and his sons slew Volsung and his sons, except Sigmund; slain by Sigmund and Sinfiotli.

SIGI: King of Huns; son of Odin.

SIGMUND: Son of Volsung; brother of Signy, who bore him Sinfiotli; husband of Hiordis, who bore him Sigurd.

SIGNY: Daughter of Volsung; sister of Sigmund; wife of Siggeir; mother by Sigmund of Sinfiotli.

SIGURD: Son of Sigmund and Hiordis; wakened Brynhild from magic sleep; married Gudrun; slain by Guttorm at instigation of Brynhild.

SIGYN: Wife of Loki.

SINFIOTLI: Son of Sigmund and Signy.

SKULD: See Norns.

SLEIPNIR (Sleipner): Eight-legged horse of Odin.

SURT (Surtr): Fire demon; slays Frey at Ragnarok.

SVARTALFAHEIM: Abode of dwarfs.

SWANHILD: Daughter of Sigurd and Gudrun; slain by Jormunrek.

THOR: God of thunder; oldest son of Odin; equivalent to Germanic deity Donar.

TYR: God of war; son of Odin; equivalent to Tiu in Teutonic mythology.

ULL (Ullr): Son of Sif; stepson of Thor.

URTH: See Norns.

VALHALLA (Valhall): Great hall in Asgard where Odin received souls of heroes killed in battle.

VALI: Odin's son; Ragnarok survivor.

VALKYRIES: Virgins, messengers of Odin, who selected heroes to die in battle and took them to Valhalla; generally considered as nine in number.

VANIR: Early race of gods; three survivors, Njorth, Frey, and Freya, are associated with Aesir.

VE: Brother of Odin; one of creators of world.

VERTHANDI: *See* Norns.

VILI: Brother of Odin; one of creators of world.

VINGOLF: Abode of goddesses in Asgard.

VITHARR (Vithar): Son of Odin; survivor of Ragnarok.

VOLSUNG: Descendant of Odin, and

father of Signy, Sigmund; his descendants were called Volsungs.

YGGDRASIL: Giant ash tree springing from body of Ymir and supporting universe; its roots extended to Asgard, Jotunnheim, and Niflheim.

YMIR (Ymer): Primeval frost giant killed by Odin, Vili, and Ve; world created from his body; also, from his body sprang Yggdrasil.

Egyptian Mythology

AARU: Abode of the blessed dead.

AMEN (Amon, Ammon): One of chief Theban deities; united with sun god under form of Amen-Ra.

AMENTI: Region of dead where souls were judged by Osiris.

ANUBIS: Guide of souls to Amenti; son of Osiris; jackal-headed.

APIS: Sacred bull, an embodiment of Ptah; identified with Osiris as Osiris-Apis or Serapis.

GEB (Keb, Seb): Earth god; father of Osiris; represented with goose on head.

HATHOR (Athor): Goddess of love and mirth; cow-headed.

HORUS: God of day; son of Osiris and Isis; hawk-headed.

ISIS: Goddess of motherhood and fertility; sister and wife of Osiris.

KHEPERA: God of morning sun.

KHNEMU (Khnum, Chnuphis, Chnemu, Chnum): Ram-headed god.

KHONSU (Khensu, Khuns): Son of Amen and Mut.

MENTU (Ment): Solar deity, sometimes considered god of war; falcon-headed.

MIN (Khem, Chem): Principle of physical life.

MUT (Maut): Wife of Amen.

NEPHTHYS: Goddess of the dead; sister and wife of Set.

NU: Chaos from which world was created, personified as a god.

NUT: Goddess of heavens; consort of Geb.

OSIRIS: God of underworld and judge of dead; son of Geb and Nut.

PTAH (Phtha): Chief deity of Memphis.

RA: God of the Sun, the supreme god; son of Nut; Pharaohs claimed descent from him; represented as lion, cat, or falcon.

SERAPIS: God uniting attributes of Osiris and Apis.

SET (Seth): God of darkness or evil; brother and enemy of Osiris.

SHU: Solar deity; son of Ra and Hathor.

TEM (Atmu, Atum, Tum): Solar deity.

THOTH (Dhouti): God of wisdom and magic; scribe of gods; ibis-headed.

Mason and Dixon's Line

Mason and Dixon's Line (often called the Mason-Dixon Line) is the boundary between Pennsylvania and Maryland, running at a north latitude of 39°43'19.11". The greater part of it was surveyed from 1763-67 by Charles Mason and Jeremiah

Dixon, English astronomers who had been appointed to settle a dispute between the colonies. As the line was partly the boundary between the free and the slave states, it has come to signify the division between the North and the South.

New and Newly Important Words and Meanings

Note: This is a selected list of words, from a wide variety of subject areas, that have become of fairly recent general interest. Many, as *radar*, *colorcast*, and *dynel*, are new in the sense that they were recently introduced into the language. Some, as *omnibus*, *libretto*, and *alligator*, are recently acquired new or extended senses of well-established terms. Others, as *rocket ship*, *snollygoster* and *fission*, are terms that have been in limited use within certain circles for a considerable time but have only recently become generally used and known. It would be out of keeping with the spirit of a list like this and beyond the space available to treat the entries in formal dictionary fashion. In general, only the commonest spellings and the most basic and important of the new senses have been given

ABSTRACT: Characterized by designs in which an artist, using lines or blocks of color rather than pictures of actual objects, attempts to set forth his feelings or ideas.

ACETATE RAYON: A rayon fiber made with cellulose acetate

ACK-ACK: An anti-aircraft gun; also, the fire of such a gun.

ACRONYM: A word formed from the initial letters or the first and last syllables of the words in a compound (*jato* from *jet assisted take-off*; *motel* from *motorists' hotel*).

ACTH: A compound obtained from the pituitary gland, used especially in the treatment of arthritis.

ACTINOMYCIN: An antibiotic isolated from certain soil bacteria.

ADDITIVE: Any substance which, when added to another product, such as gasoline or a storage battery, is supposed to make it more powerful or longer-lasting.

AEROEMBOLISM: An abnormal bodily condition, called also *air bends*, due to the formation of nitrogen bubbles in the blood and spinal fluid brought about by rapid ascent into high altitudes.

AGITPROP: Serving as a means for spreading propaganda intended to promote militancy among the common people;—applied originally to pro-Communist activities.

AIRLIFT: A supply line operated by aircraft.

AIRSTRIP: A hard-surfaced runway for the take-off and landing of aircraft; also, a portable runway made of steel sheets.

ALCOMETER: A device for detecting drunkenness by measuring the amount of alcohol in a sample of exhaled air.

ALERT: A signal to warn of danger, as from hostile aircraft; also, the period of time in which the signal is in effect.

ALLIGATOR: A flat-bottomed, armored military vehicle for use on land or water.

ALL-OUT: Making use of all available power and resources (as, an *all-out* effort).

AMPLITUDE MODULATION or **AM:** A system of radio broadcasting in which the amplitude of the carrier wave is modulated in accordance with the form of the sound or signal wave.

AMTRAC: An amphibious tractor, used chiefly as a military vehicle.

ANGLE: A special approach or technique for achieving an end, as for writing a news story or promoting an interest.

ANTIBIOTIC: A substance produced by a living organism, especially by a bacterium or fungus, that is used to kill or stop the growth of disease germs.

ANTIHISTAMINE: An agent used in the prevention or treatment of allergic reactions.

AQUACADE: An elaborate water show consisting of exhibitions of swimming, diving, and acrobatics, accompanied by music.

ARENA THEATER = **THEATRE-IN-THE-ROUND**.

ARTIFICIAL INSEMINATION: Introduction of semen into the genital tract of a female animal by other than the natural means.

ASTRODOME: A transparent dome on the upper surface of an airplane from which the navigator makes celestial observations.

ATEBRIN: An antimalarial drug, quinacrine dihydrochloride.

ATOMIC BOMB, ATOM BOMB, or A-BOMB: A bomb with violent explosive power that is due to a sudden release of atomic energy.

ATOMIC COCKTAIL: A radioactive substance such as sodium iodide, dissolved in water and given as a drink to cancer patients.

AUDIO: Pertaining to or used in the transmission or reception of sound in TV.

- AUDIOPHILE:** One who is enthusiastic about sound, especially music from high-fidelity broadcasts or recordings.
- AUDIOVISUAL:** Involving both hearing and seeing (as, *audiovisual* education uses films, slides, phonograph records, and the like, to supplement instruction).
- AUREOMYCIN:** An antibiotic isolated from a soil microorganism.
- AUSTERITY:** A severe or enforced economy characterized by a lack of luxuries (as, postwar *austerity* in Great Britain).
- AUTOMATIC TRANSMISSION:** Automotive transmission in which the gears are shifted automatically.
- AUTOMATION:** The substitution of machines or mechanical devices for human beings in a manufacturing process.
- BABUSHKA:** A triangular kerchief worn over the head and tied under the chin.
- BABY SITTER:** One who is hired, usually for a few hours, to care for children while the parents are absent from the home.
- BALL-POINT PEN:** A fountain pen in which the writing point is a tiny ball that rotates freely against an inking magazine.
- BAMBOO CURTAIN:** The military, political, and propaganda barrier isolating territory controlled by the Chinese Communists.
- BANK:** A place for storing a reserve supply; —occurs in such combinations as *blood bank*, *eye bank*, *bone bank*, *skin bank*.
- BANKROLLER:** One having a sizable bankroll or a ready and ample supply of funds.
- BARBITURATE:** One of a large group of drugs often used as sedatives or antispasmodics.
- BARREL:** To move at a high speed in a straight course; —used especially of vehicles.
- BASIC ENGLISH:** A copyrighted system intended to simplify the learning of English by the use of a vocabulary limited to the 850 most essential words.
- BATHYTHERMOGRAPH:** An instrument for recording the temperature variations of sea or fresh water according to depth.
- BAZOOKA:** A portable rocket-launcher, used chiefly as an antitank weapon.
- BEACHHEAD:** An area on an enemy shore which an advance force occupies and defends.
- BEAM:** A directional radio signal for guiding aircraft, audible as a continuous tone as long as the aircraft stays on course, but as a broken tone if it veers to the left or right.
- BEBOP:** A style of jazz with many notes to the measure, usually played loud and fast and characterized by changing of key and accenting of odd beats.
- BELLYLAND:** To land an airplane on the under side of its fuselage without using the landing gear.
- BENTHOSCOPE:** A steel sphere used for deep-sea diving and observation.
- BETATRON:** An apparatus in which electrons are accelerated to high speed and formed into beta rays for use in generating high-voltage X-rays or for nuclear bombardment.
- BIG WHEEL, slang:** An important, impressive person; sometimes one who only feels himself important.
- BIKINI:** A woman's two-piece bathing suit of abbreviated style.
- BINAURAL SOUND:** Sound recorded or transmitted by pairs of equipment in order to give the listener the effect of having heard the original with his own two ears.
- BIOLOGICAL WARFARE:** Warfare in which living organisms, especially disease germs, are used against human, animal, and plant life; also, warfare involving the use of synthetic chemicals against plants.
- BIRD, slang:** An enthusiast (as, a *bird* about music); also, any person thought to be odd or strange.
- BITCH, slang:** To gripe; to complain.
- BLACK MARKET:** Trade in violation of official controls or restrictions, especially those concerning price ceilings, rationing, and priorities; also, a market or group carrying on such trade.
- BLISTER:** A compartment, often covered by a transparent dome, that protrudes from the fuselage of an aircraft and is usually occupied by a gunner or observer.
- BLITZ:** A violent, swift military attack; also, any sudden, overpowering attack; —short for *blitzkrieg*.
- BLOCKBUSTER:** A huge, high-explosive demolition bomb, usually one weighing two, four, or six tons.
- BLOODMOBILE:** An automobile equipped for collecting blood from volunteer donors.
- BLUEPRINT:** A detailed plan for a project or program of action (as, a *blueprint* for mobilization).
- BLUE RIBBON JURY:** A panel of jurors selected for qualifications such as education or property ownership, that may be called to sit in complicated cases.
- BOBBY SOCK:** A girl's sock reaching above the ankle.
- BOBBY SOXER:** A young girl, especially one in the early teens; —from the wearing of bobby socks.
- BOMB:** A small container in which a liquid, as an insecticide, is held under pressure and released as a spray.
- BOOBY TRAP:** An explosive device concealed and attached to some harmless-looking object; also, any trap for the unsuspecting.
- BOOGIE-WOOGIE:** A style of playing blues on the piano, characterized by a persistent bass rhythm and elaborate treatments of a simple melody, often in contrary motion to the bass.
- BOOKBURNING:** Systematic destruction, usually by a government, of books believed to contain dangerous ideas; hence, the suppression of ideas.
- BOOKMOBILE:** A closed autotruck with shelves of books, which serves as a traveling library or bookstore.
- BOOSTER:** A device for strengthening radio or television signals in areas where the reception is weak.
- BOP:** Short for *bebop*; also, one fond of *bebop*.
- BOTTLENECK:** To delay progress; to hold up a process, especially at a critical point.
- BOYS' TOWN:** A farm or school for homeless or delinquent boys, organized like a town and governed by the boys themselves.

BRAINWASHING: The forcible replacement of one set of political ideas by another set, especially through indoctrination or mental torture.

BRASS: Military and naval officers of high rank or position, especially those in top commands.

BREAK: A short rest period, often one set aside from the working day.

BRIEF: To give final, last-minute instructions or information (as, to *brief* the crew of a bomber before a mission).

BROWNOUT: A dimming of street lights and various other outdoor lighting, chiefly to conserve fuel supplies.

BRUSHOFF: A curt or offhand dismissal (as, to give someone the *brushoff*).

BUDGIE: Short for *budgerigar*, the zebra parakeet.

BUILD-UP: Extremely favorable notice, as by the press or radio, designed to popularize a product, personality, or organization.

BUILT-IN: Functioning as a part of, but separately identifiable from, a given unit (as, *built-in* shelves); also, conditioned (as, a *built-in* reaction).

BULLDOZER: A tractor-driven machine with a broad, blunt horizontal blade or ram, used especially in road building and clearing land.

BUMP: To push (a person) out of his place in order to take it for oneself (as, to *bump* a man from his job).

BURGER: A sandwich usually made of a flat roll cut in half and filled either with hamburger or another food specified (as, *pork-burger* or *beefburger*).

BURP GUN: A machine pistol.

BUTADIENE: A colorless gas, made from petroleum and alcohol, used in the making of synthetic rubber.

BUY, *slang*: To accept; to agree to; to assent (as, to *buy* an idea or an argument).

BUZZ: To fly an airplane fast and at a low altitude over (as, to *buzz* an airfield).

CABANA: A beach shelter resembling a cabin, usually with an open side facing the sea.

CADRE: A nucleus of thoroughly indoctrinated leaders who actively promote the interests of a communist or revolutionary party.

CAFÉ CURTAINS: Plain, straight-hanging curtains, usually hung on poles by loops or rings, used to cover the lower part of a window or door.

CAFÉ SOCIETY: People who frequent fashionable cafés and night clubs.

CALYPSO: A ballad in African rhythm, often a parody or a satire on current events, sung especially by natives of the British West Indies as part of a pre-Lenten carnival.

CANDID CAMERA: A camera, usually a small one with a fast lens, used for taking unposed, informal pictures, usually without the subject's knowledge.

CANNIBALIZE: To dismantle a machine in order to get parts for use as replacements in other machines.

CAPSULE: Of a small type or in a condensed or streamlined form (as, a *capsule* review, criticism, or submarine).

CAPTIVE AUDIENCE: An audience obliged to stay within hearing of a speech or broadcast, often being subjected to advertising or propaganda.

CARD-CARRYING MEMBER: A Communist to whom a party membership card has been issued and who presumably carries it on his person.

CARHOP: A waiter or waitress at a drive-in restaurant who serves food and drinks to customers in their parked cars.

CARPORT: A roofed shelter for an automobile, usually attached to another building, and with two or more open sides.

CARTRIDGE: A removable pickup in the tone arm of a phonograph.

CASUAL: Of clothing, designed in a simple, easy style suitable for informal or sports events.

CEILING: A maximum, as for a price, wage, fee, or rent, which is fixed as the upper legal limit by government authority, usually on the basis of the level prevailing at a certain date.

CERAMAL = CERMET.

CERMET: A strong, heat-resistant metallic alloy.

CHAIN REACTION: In chemistry and physics, a process which can continue itself because one of its resulting products is always able to start the process anew until the original material is used up.

CHALKBOARD: A smooth flat surface, often of slate or composition, for writing on with chalk.

CHALKTALK: A talk or lecture which the speaker illustrates by making drawings or cartoons as he talks.

CHANNEL: A narrow band of frequencies on which a radio or television program may be transmitted.

CHARACTER ASSASSINATION: The attempt to discredit or destroy the reputation of another person, often by making vague, unproved accusations.

CHEAP: Having a depreciated purchasing power or value, especially as the result of a currency inflation (as, *cheap* dollars).

CHEESECAKE: Photography or photographs intended to display or accent female charms or attractions; also, any photograph having a considerable amount of sex appeal.

CHICHI, *slang*: Stylish; chic; fashionable; also, affected or esoteric.

CHLORAMPHENICOL: An antibiotic effective against certain rickettsiae and viruses.

CHLORDANE or CHLORDAN: An odorless liquid insecticide.

CHORAL SPEAKING: Interpretive reading or recitation, usually of poetry or rhythmic prose, by a group of voices known as a *speech choir*.

CHOREOGRAPH: To compose and arrange a ballet or dance; also, to provide a subject or a piece of music with a ballet or dance.

CHOROSCRIP: A system of notation used in teaching and recording dance figures and steps.

CINCHER: A wide, snug-fitting ornamental belt for women.

CLASSIFIED: Forbidden to be revealed out-

- side authorized circles, for reasons of national security.
- CLOAK-AND-DAGGER:** Of literature, dealing in intrigue and melodramatic action, usually of characters in a colorful historical setting, and involving espionage, duels, or the like.
- CLOBBER, slang:** To beat or pound mercilessly; also, to defeat overwhelmingly.
- CLOSED CIRCUIT:** Television transmission in which the signal is not broadcast but can be received only by interconnected receivers.
- CLOUD CHAMBER:** A closed vessel containing saturated water whose sudden expansion makes visible by a trail of white droplets the passage of an ionized particle.
- CLOUD SEEDING:** The introduction of a substance, as dry ice or silver iodide, into certain types of clouds in order to cause rainfall.
- CLOVERLEAF:** A road plan resembling a four-leaf clover, in which one road passes over another, permitting traffic to merge without left-hand or abrupt turns or direct crossings.
- CLUTCH:** A critical point; a pinch (as, to come through in the *clutch*).
- CLUTCH BAG:** A woman's purse or bag, usually small and without a handle, which is carried in the hand.
- COAXIAL CABLE:** A cable used in the transmission of telegraph, telephone, and television signals, consisting of a tube of conducting material surrounding but insulated from a central conductor.
- COFFEE BREAK:** A rest period during the working day, allowing the employee time for a cup of coffee.
- COLD FRONT:** In meteorology, the forward boundary of a mass of cold air.
- COLD WAR:** A struggle between two nations or groups of nations, waged by use of political and economic strategy, propaganda, and other measures short of armed combat.
- COLD WAVE:** In hairdressing, a permanent wave produced by a chemical solution.
- COLLECTIVE SECURITY:** Security of all the members of an association of nations from aggression by any other nation or nations.
- COLORCAST:** A television broadcast in color.
- COMBO:** A small group of musicians, usually jazz players;—from *combination*.
- COMIC BOOK:** A paper-bound book made up of a series of cartoons or comic strips, sometimes humorous, often telling a story of adventure or crime.
- COMMANDO:** A band or unit of troops specially trained for making surprise raids into enemy territory; also, a member of such a unit.
- COMMERCIAL:** That portion of a sponsored radio or television program devoted to advertising; also, the script prepared for the advertising announcement.
- COMMIE:** A member or agent of the Communist party; also, a fellow traveler.
- COMPATIBLE:** Designating a system in which color television broadcasts may also be received in black and white on receivers not specially equipped for color reception.
- COMPOUND F:** A hormone used in the treatment of arthritis.
- CONDITIONER:** A substance which, when added to soil, improves aeration, workability, and crop yield.
- CONSCRIPT:** To enroll by compulsion for military service.
- CONTACT LENS:** A lens of glass or plastic fitted to the eyeball, worn instead of the usual eyeglass to correct defects of vision.
- CONTAINMENT:** Restraint; specif., the restriction of Communism to fixed territorial limits.
- CONTOUR FARMING:** A system of farming in which plowing and planting follow the contour lines of sloping land, thus retarding erosion from the runoff of rainwater.
- CONVERSATION PIECE:** Any unusual or distinctive article, as of clothing or furniture, which is likely to attract attention and provide a subject for conversation.
- CONVERTER:** A device for adapting a television receiver to receive channels other than those for which it was designed.
- CONVERTIPLANE:** An aircraft that takes off and lands like a helicopter but flies like a conventional airplane.
- COOKOUT:** An outing at which a meal is cooked and eaten in the open.
- CORN:** Corny acting or playing.
- CORNY:** Trite, stale; old-fashioned, or countrified; also, of music, played or sung in a bland, unsophisticated style.
- CORONARY THROMBOSIS:** A blood clot (a *thrombus*) occurring in an artery of the heart.
- CORTISONE:** A compound used in treating rheumatoid arthritis and certain allergies.
- COUNTER-INTELLIGENCE:** Organized activities of military intelligence services designed to block enemy sources of information and deceive the enemy by ruses, misinformation, and the like.
- COUNTERWORD:** A word used in popular speech in such a variety of situations that its original, specific meaning is lost and it serves only as a counter or token used in place of a more definite word (examples: *swell, awful, nice*).
- COURTESY CARD:** An identification card which supposedly assures its holder of favors or special treatment, as from the police.
- CRACK UP:** To crash or cause to crash, as an airplane; hence, to break down; collapse; go to pieces.
- CRASHLANDING:** An airplane landing in which the plane is either damaged or destroyed.
- CREDIT LINE:** A line, note, or name published with an article, news story, photograph, or the like, acknowledging the source.
- CREEPING:** Making, or thought to be making, inroads or undesired progress (as, *creeping socialism*).
- CREW CUT:** A short-cropped, bristly haircut for men.
- CURVACEOUS:** Having a feminine figure which is well-proportioned and marked by pronounced curves.
- CUTBACK:** A reduction in a prevailing rate, amount, or number (as, a production *cut-back*).

CYBERNETICS: Comparative study of the control system in the human brain and nervous system with that in such mechanical-electrical communication systems as computing machines.

CYCLOTRON: An apparatus used for imparting high speeds to electrified particles, used especially to bombard the nuclei of atoms in order to produce transmutations and artificial radioactivity.

DAISY: A circular cheese, usually about 12 to 14 inches in diameter and weighing between 18 and 24 pounds.

DDT: A colorless, odorless insecticide, used especially against body lice, flies, mosquitoes, and agricultural pests.

DEAD DUCK: Anything doomed or past recovery.

DEADPAN: A completely expressionless, immobile face.

DECAMISADO: A member of the Argentine working class.

DECONTROL: To remove control from (as, to decontrol the price of eggs).

DE-EMPHASIZE: To diminish in importance; to make less prominent (as, a move to de-emphasize football at a college).

DEEP-FREEZER: A cabinet where food may be quick-frozen and stored.

DEFICIT SPENDING: Spending in excess of income;—usually applied to a government.

DEGREE DAY: A unit that represents one degree of declination from any given point in the mean outdoor temperature for a day, often used in measuring fuel requirements for a building.

DE-ICER: Any system or mechanism used to rid or keep free of ice the wings and tail of an aircraft.

DELTA WING PLANE: A fast, high-flying airplane, triangular in shape, like the Greek letter delta.

DELTIOLGY: The hobby of collecting post cards.

DENAZIFY: To rid (the people or institutions of a Nazified country) of Nazism and its influence.

DENSENSITIZE: In psychiatry, to free from a neurotic state; to make immune to a morbid emotional domination.

DETECTAPHONE: A telephone apparatus equipped with a microphone transmitter, used especially for listening secretly.

DETERGENT: A soluble or liquid preparation, often called "soapless soap," that resembles soap in its ability to emulsify oils and hold dirt in suspension.

DIAL TONE: A steady hum, audible in a telephone receiver, indicating that the line is free and a number may be dialed.

DILLY: Something of superior or remarkable quality; often, something presenting unusual difficulties or complications.

DIM OUT: To obscure in dimness, as by restricting illumination to specks or slits of light, lights shaded from above, or blue lights.

DIRECTIVE: An order or instruction as to plan or procedure, such as might be issued by a military official, or by a government or business executive.

DISC JOCKEY or DISK JOCKEY: One who

conducts and announces a program of musical records, usually with advertising or nonmusical comments interspersed.

DISCOGRAPHY: A descriptive, classified catalogue or listing of phonograph records, usually including dates and performers.

DISCOPHILE: An enthusiastic collector or student of phonograph records.

DISPLACED PERSON or DP: A person driven or deported from his home country during World War II as a prisoner of war, or for forced labor, or because of his race, politics, or religion.

DOCUMENTARY: A film that depicts in artistic form a factual and authentic presentation, as of an event or a social or cultural phenomenon.

DOODLE: An aimless, somewhat automatic design, sketch, or scribbling made while one's mind is occupied with something else.

DOSIMETER: A device for measuring the amount of radioactivity absorbed by the body.

DOUBLE-DOME: A highbrow; an intellectual.

DOUBLE-TAKE: A delayed reaction to the importance or meaning of something that at first escaped notice;—usually in the phrase, to do a *double-take*.

DOUBLE TALK: Talk or writing that appears to be earnest and meaningful but is actually a mixture of sense, gibberish, and unintelligible verbiage.

DOUBLE-THINK: The ability to have in mind at the same time two contradictory beliefs and accept both;—coined by George Orwell in the novel *Nineteen Eighty-Four*.

DRIVE-IN: A place of business, as a theater or restaurant, designed to permit patrons to remain in their automobiles while watching a performance or making purchases.

DRONE: A pilotless airplane controlled by radio from the ground or another plane; also, a vessel similarly controlled.

DRUNKOMETER: A device for detecting and measuring the degree of alcoholic intoxication by analysis of the breath.

DUB: To provide (a film) with a new soundtrack; to blend music or sound effects into (a radio or television broadcast).

DUCK: An amphibious military vehicle having wheels and a propeller, that can be used as either a truck or a barge.

DYNEL: A synthetic textile fiber in staple form; also, the material made from this fiber.

EARMOLD: The portion of a hearing aid that fits into the ear.

ECDYSIASIS: A strip-teaser;—a humorous term coined by H. L. Mencken.

EGGHEAD: An intellectual; a highbrow.

ELDER STATESMAN: A man who has retired from active public life but continues to act as an unofficial advisor, especially to government officials.

ELECTRONICS: The branch of physics that deals with the emission, motion, and effects of electrons.

ELECTROSHOCK: A state of shock induced by the passage of an electric current through the brain and useful in the treatment of certain mental disorders.

EMCEE: A master of ceremonies;—from *M. C.*

- ENRICH:** To improve (a food) in nutritive value by adding vitamins and minerals to it during processing.
- ESCALATOR CLAUSE:** A clause in a contract providing adjustment to cover such possibilities as increases or decreases in costs of labor, material, or living.
- ESCAPE LITERATURE:** Literature or writing providing mental escape or distraction from routine or reality.
- EXPEDITER:** One whose job it is to ensure an adequate supply of raw materials for fulfilling production contracts and to direct the movement of processed goods to where they are needed or wanted.
- EXPOSURE METER:** An instrument used by photographers for indicating the correct amount of exposure under varying light conditions.
- EXPRESSWAY:** A superhighway.
- FADE:** In radio and television, to change gradually in loudness or distinctness (as, to *fade* a picture or a sound in or out).
- FAIR-TRADE AGREEMENT:** An agreement between the manufacturer and the distributor of a trade-marked article, prescribing a minimum price for its sale.
- FALTBOT:** A collapsible boat similar in size and shape to a kayak.
- FAST BUCK:** Money that can be made readily or quickly, usually with little effort.
- FEATHERBED RULE:** A union rule that requires an employer to hire unneeded workmen or to pay for duplication of jobs; also, one limiting the amount of work that workmen may do in a day.
- FEATHER MERCHANT, slang:** One who tries for easy jobs or is thought to be lazy; also, *military slang*, a civilian.
- FEATURETTE:** A short feature; specif., a motion picture of less than the usual length.
- FEEDBACK:** A partial return of the effects or product of a process to its source or to a preceding stage;—used especially of social, psychological, or biological systems.
- FELLOW TRAVELER:** One who sympathizes with and, often, furthers the program or ideals of, a group (originally, the Communist party) without being a member of the group.
- FIFTH COLUMN:** Secret supporters of an enemy engaged in sabotage or other subversive activity within defense lines.
- FINGER PAINTING:** A technique in which splotches of pigments (*finger paints*) are applied to wet paper and spread with the hands or fingers to form a picture or design.
- FISSION:** The splitting of the nucleus of an atom into two nearly equal parts, resulting in a tremendous release of energy.
- FISSIONABLE:** Capable of undergoing fission.
- FIVE PERCENTER:** One who undertakes to aid businessmen in obtaining contracts or doing other business with the government, usually for a fee of five per cent.
- FLAME-OUT:** A sudden blowing-out of the fire of a jet engine, caused by improper functioning of the fuel-supply system.
- FLIPOVER CARTRIDGE:** A phonograph cartridge that has separate needles for playing both microgroove and standard records and that may be turned to bring the proper needle into playing position.
- FLUFF:** To bungle or stumble in delivering one's lines during a performance; also, to miss a cue.
- FLUID DRIVE:** An automotive power coupling between the flywheel of the engine and the transmission gears that operates on a hydraulic turbine principle.
- FLUORIDATION:** Treatment of drinking water with a fluoride to prevent tooth decay.
- FLYING SAUCER:** Any of various unidentified objects, usually described as disc- or saucer-shaped, reportedly seen in the air.
- FOAM RUBBER:** A spongy, fine-textured rubber used especially for cushions, mattresses and the like.
- FOLD:** To discontinue production or business for lack of patronage or because of public neglect (as, the stage play *folded* after only two performances).
- FRAME OF REFERENCE:** The environment of personal knowledge or experience in which an idea is conceived or interpreted.
- FREELoader:** A "sponge"; one who frequently obtains something (as food or drink) that is paid for by someone else.
- FREEWAY:** An express highway that bypasses towns and is largely free of intersections; a superhighway.
- FREEZE:** To fix inflexibly, as by an executive order, at a given level or in the status on a given day (as, to *freeze* a price or a design).
- FREQUENCY MODULATION or FM:** A virtually static-free system of radio broadcasting in which the frequency of the carrier wave is modulated in accordance with the form of the sound or signal wave.
- FRINGE AREA:** An area on the outer edges of one having a greater strength or concentration (as, a *fringe area* for television reception).
- FRINGE BENEFIT:** Any benefit, such as health insurance or sick leave, not included in the basic wage, that workers receive from their employers.
- FROGMAN:** A person equipped for extended periods of underwater swimming, usually for military reconnaissance or underwater demolition.
- FRONT:** A person or group serving as public representative for a pressure group or subversive organization, often unwittingly, while thinking to act in public or patriotic interests.
- FUSED COLLAR:** A collar, especially one on a man's shirt, that has been lined or otherwise treated to retain its shape.
- GADGETEER:** An inventor or maker of gadgets; also, one given to buying or using them.
- GAGSTER:** A writer of gags or jokes, especially for radio and television programs.
- GAMMA GLOBULIN:** A fraction of blood plasma rich in antibodies and used against diseases such as polio and hepatitis.
- GAPA:** A rocket-powered guided missile used against aircraft and against other missiles;—from ground-to-air pilotless aircraft.
- GENOCIDE:** A calculated attempt to destroy systematically a racial, religious, or polit-

- ical group; also, an effort to destroy the language, religion, or culture of a group.
- GERIATRIC:** Of or pertaining to *geriatrics*, the branch of medicine dealing with old age and its diseases; also, aged (as, the *geriatric* patient).
- GHETTO:** A quarter of a city in which members of a racial group are segregated by social and legal pressure.
- GI:** A person who is serving or has served as an enlisted member of the U. S. armed forces.
- GIMMICK:** A trick; a clever or artful device or scheme.
- GISMO:** A gadget; device; contraption; also, anything without a name.
- GIVEAWAY:** A radio or television show in which members of the audience participate and receive prizes.
- GOBBLEDYGOOK:** Involved or obscure language such as is frequently found in official pronouncements.
- GOLDBRICK, slang:** To shirk or find excuses to evade assigned work.
- GOOFBALL, slang:** A sleeping tablet, especially one of the barbiturates.
- GOOGOL:** In mathematics, the figure 1 followed by 100 zeros.
- GRASSROOTS:** The farming districts of the country; also, the people living in them, thought of as a politico-economic group holding firm and independent views.
- GRAVEYARD SHIFT:** The third of three daily shifts, as in a factory, usually beginning at midnight.
- GREEN THUMB:** A special or unusual ability to make plants grow;—usually in the phrase, to have a *green thumb*.
- GREMLIN:** An impish gnome, whimsically accused by armen of tampering with motors, instruments, and the like.
- G SUIT:** An inflatable suit worn by aviators during rapid aerial maneuvers to counteract the effects on the body of pressure greater than gravity.
- GUIDED MISSILE:** Any missile whose course may be directed during passage by a built-in target-seeking device or by radio control.
- GUN:** To open the throttle of (an engine) to increase the speed.
- GYROPILOT:** A control mechanism, sometimes called *automatic pilot*, that keeps an airplane in level flight and on a set course.
- HALF-TRACK:** One of the endless chain-tracks used instead of the rear wheels on a certain type of vehicle; also, a tractor or truck with half-tracks and front wheels.
- HARDTOP:** An automobile having most of the characteristics of a convertible, but with a stationary steel top.
- HASSLE:** A mix-up; also, an argument or fight.
- H-BOMB or HYDROGEN BOMB:** An extremely powerful fusion bomb.
- HEDGEHOP:** To fly an airplane so low that it has to "hop" over trees and hedges.
- HELIPORT:** A place for helicopters to land in order to discharge or receive passengers or cargoes.
- HEPCAT:** A musician in a jazz band; also, a devotee of jazz.
- HEX:** A spell or enchantment; a jinx (as, to put the *hex* on someone).
- HIGH FIDELITY or HI-FI:** The reproduction of sound, usually by a radio or phonograph, with a high degree of faithfulness to the original.
- HIT PARADE:** A listing, as of popular songs or books, in order of current public preference.
- HOOD, slang:** A hoodlum; a rowdy.
- HOOPER or HOOPERATING:** An indication, based on the results of telephone polling, of the popularity of a radio or television program.
- HORSE'S TAIL = PONY TAIL, below.**
- HOT:** Radioactive; also, having to do with radioactive material (as, a *hot* laboratory).
- HOT ROD, slang:** An out-of-date automobile with the trimmings stripped off and the engine stepped up to permit high speeds.
- HOWGOZIT CURVE:** A running graph of the progress of an aircraft flight, especially a transoceanic one.
- HUCKSTER:** One whose business is commercial advertising, especially the preparation of clever, effective advertising programs for radio and television broadcasts.
- HYBRID CORN:** A crossbreed of Indian corn developed from selected strains and having the best characteristics of each.
- HYDROPONICS:** The growing of plants, especially vegetables, with their roots in water that contains the essential minerals, instead of in soil.
- HYPERTENSION:** Abnormally high arterial blood pressure; also, the resulting systemic condition.
- INFLUENCE PEDDLER:** One who tries to get special privileges, especially from the government, for his clients; a five-percenter.
- IN-SERVICE:** Taking place or continuing while in service (as, *in-service* training).
- INSTITUTE:** A short program of instruction or conferences for people already at work in a given field (as, a farmers' *institute* or a bankers' *institute*).
- INTERCOM:** A two-way short-distance communication system with microphones and loud-speakers at each end;—short for *intercommunication system*.
- IRON CURTAIN:** A barrier created by such means as censorship and prohibition of free travel to isolate Russian-controlled territory from outside contacts; hence, any similar barrier against communication.
- IRON LUNG:** A tank device for artificial respiration that forces air into and out of the patient's lungs.
- ISOBAR:** One of two atoms or elements having the same atomic weights but different atomic numbers.
- ISRAELI:** Of or relating to the Jewish state of Israel, in Palestine.
- ISSEI:** A Japanese immigrant to the U. S.; legally, an alien.
- JATO UNIT:** An auxiliary means of propulsion in which rocket engines are used to assist the take-off of an airplane;—from *jet* assisted take-off.
- JEEP:** A small, rugged multipurpose motor vehicle; originally one having four-wheel drive.

- JET PROPULSION:** Propulsion of a body by forces resulting from the rearward discharge of a jet (a high-speed stream of fluid) through an orifice. The forces are a reaction to the discharge of the jet, in accordance with the Newtonian law that to every force there is an equal and opposite reaction.
- JIVE:** The slang or jargon used by swing musicians and jitterbugs; also, any similar slang.
- JUKEBOX:** A coin-operated automatic phonograph-record player.
- JUNKIE, slang:** A narcotics user or addict.
- KEYNESIAN:** Of or pertaining to a system of economics (often associated with the New Deal) advocating considerable government participation in the economic affairs of a country.
- KICKBACK:** The return of part of a sum received, as of wages or fees, prompted by a previous confidential agreement or by coercion.
- KINESCOPE:** A form of cathode-ray tube with a screen at one end on which television pictures or oscillographs may be produced;—called also *picture tube*.
- KINESICS:** The study of such body motions as winks and waves as related to communication between people.
- KNOW-HOW:** Technical skill and practical ability; competence in planning or producing something.
- LANDING CRAFT:** Any of numerous naval warcraft designed for putting ashore troops or equipment in beach assaults.
- LATCH ON TO:** To attach oneself; also, to appropriate; to take over.
- LEFTIST:** One who belongs to a radical or revolutionary party; also, one who holds or advocates ultraliberal principles.
- LEPROMIN TEST:** A test for the recognition of immunity to leprosy.
- LIBRETTO:** The plan or scenario for a ballet.
- LIQUIDATE:** To kill secretly; also, to eradicate ruthlessly.
- LOAFER:** A man's or woman's low leather step-in shoe, resembling a moccasin but having a flat heel and stiff outsole.
- LOBOTOMY:** A leucotomy; an incision into the frontal lobe of the brain to sever nerve fibers in an attempt to relieve certain mental disorders.
- LOCKER PLANT:** A business establishment having quick-freezing equipment and lockers for storing frozen foods.
- LONGHAIR:** Idealistic; intellectualized; high-brow (as, *longhair* music or *longhair* writing).
- LOYALTY OATH:** A signed statement of loyalty, often one in which the signer affirms loyalty to the U. S. and denies any Communist connections or sympathies.
- LYSENKOISM:** A biological doctrine advanced by T. D. Lysenko, Russian agronomist, in defiance of orthodox genetics.
- MAE WEST:** A yellow life-saving jacket that can be inflated by two cartridges of carbon dioxide, worn especially by airmen in flights over water.
- MEGADEATH:** One million deaths (as, the power of an atomic bomb may be indicated in terms of *megadeaths*).
- MEGATON:** A million tons; also, an explosive force equal to that of a million tons of TNT;—used especially with reference to a hydrogen bomb.
- MERCY KILLING:** Euthanasia; killing, especially in a quick, painless manner, to put the victim out of extreme pain or misery.
- ME-TOO-ISM:** The echoing of another's opinions or attitudes, usually implying an inability or unwillingness to think for oneself.
- MICROFILM:** A strip of film on which a reduced-size photographic record of printed matter may be kept in a small space.
- MICROGROOVE:** A narrow V-shaped groove used on phonograph records intended to play at speeds of 33 1/3 or 45 revolutions per minute.
- MIDDLEBROW:** Middle-class; midway between highbrow and lowbrow.
- MILK BAR:** A place where milk, ice cream, and other dairy products are sold and may be consumed.
- MOBILE:** A delicately balanced type of sculpture, usually having movable parts which can be set in motion by air currents or other means.
- MOLOTOV COCKTAIL:** A crude explosive device, typically, a gasoline-filled bottle capped with an oil-soaked rag that is ignited just as the bottle is thrown at the target.
- MOMISM:** A supposed excessive admiration and sentimentalizing of mothers, thought to permit a possessive mother to deny her offspring emotional independence.
- MONITOR:** To check (a radio or television transmission) for quality or fidelity to band; also, to check (as a broadcast) for military or political significance.
- MONOLITHIC:** Consisting of one large, undifferentiated whole, exhibiting one harmonious pattern throughout (as, a *monolithic* party or culture).
- MONTAGE:** The production of one complete picture by combining several distinct ones, often in such a way that they blend with or into each other.
- MORETIC:** Pertaining to mores or social conventions.
- MOTEL:** A hotel or group of furnished cabins or attached cottages, situated near a highway, offering accommodations to automobile tourists.
- MOTHBALL:** That which has been placed in indefinite, protective storage (as, a *mothball* fleet or airplane).
- MOTORCADE:** A parade or procession of automobiles.
- MOTOR POOL:** A group or fleet of motor vehicles for use as needed by different organizations or individuals.
- MULTIPHASIC:** Having or considered in terms of many aspects or phases (as, a *multi-phasic* approach to a problem).
- MUSCULAR DYSTROPHY:** A hereditary disease in which there is progressive wasting away of the muscles.
- NAPALM:** A thickener used to gel gasoline for incendiary bombs and flame throwers.
- NEEDLE:** To vex or annoy by repeated sharp gibes; also, to goad or prod.

NEWSCASTER: One who broadcasts news, as on radio or television; also, a commentator.

NIACIN: A member of the B-vitamin group useful in the prevention of pellagra;—called originally *nicotinic acid*.

NISEI: A U. S. citizen born of Japanese immigrant parents.

NONOBJECTIVE: In art, creating effect through shapes and colors not intended to represent actual objects; abstract.

NO-SHOW: A passenger who, after making a reservation on an airplane, does not show up to claim it at flight time and has made no cancellation.

NUCLEAR: Having to do with the atomic nucleus (as, *nuclear physics*).

NURSERY SCHOOL: A center for children, usually under 5 years of age, providing supervised play and social training for a few hours a day.

NYLON: A synthetic material that can be fashioned into tough, strong, elastic threads and used in making brush bristles, hosiery, textile fabrics and the like.

OCCUPATIONAL THERAPY: The treatment of disease or injury by giving the patient regulated work that will help his recovery or rehabilitation.

OMNIBUS: A book of reprints, usually one containing works of the same type or by a single author.

OPPOSITE NUMBER: A person or position in one system corresponding to one in another (as, an ensign is the *opposite number* of a second lieutenant).

OSCAR: One of the statuettes awarded annually for highest excellence in motion picture work; hence, any annual award for excellence.

PACKAGE: A fully constructed, prearranged program or plan, such as a radio show or tour, usually offered for sale at a flat sum; also, any finished product made ready for immediate use by preassembling all essential elements into a unit.

PAN: To move (a camera) in order to follow a moving object or secure a panoramic effect.

PANIC SWITCH: The control on the ejector mechanism that throws a jet pilot from his plane in case of emergency.

PARAPSYCHOLOGY: A branch of psychology concerned with investigating evidence for telepathy, clairvoyance, and the like, and with experiments in the field of extrasensory perception.

PARA-RESCUE TEAM: A team of rescuers who drop by parachute, as to the scene of a plane crash, in order to give immediate aid to anyone in distress.

PARITY: The balance between the prices the farmer receives for his products and the prices he has to pay for the things he must buy.

PARTISAN: A member of a guerilla band working behind enemy lines and engaged in such activities as sabotage, demolition, and diversionary attacks.

PARTY DISCIPLINE: The discipline imposed on its members by a party;—usually applied to the Communist party.

PARTY LINE: The policy or course of action

followed by a party, originally specifically by the Communist party.

PATCH TEST: A test for determining susceptibility, made by applying to the skin small pads soaked with the allergy-producing substance in question.

PEDAL PUSHERS: Women's trousers, usually calf-length, for sports wear.

PENICILLIN: An antibacterial substance extracted from green mold, useful in treating infections.

PERIL POINT: The lowest rate to which a tariff can be reduced without injuring the industry of the country levying it.

PHOTOMURAL: An enlarged photograph, usually several yards long, affixed to a wall as decoration.

PICTURE TUBE = KINESCOPE.

PICTURE WINDOW: An extra-large window, usually in a living room, framing a desirable outside view.

PIGGY-BACK PLANE: A small airplane carried aloft on the "back" of a larger one, from which it is released in mid-air.

PIPE: In radio and television, to transmit (a program) by wire or coaxial cable.

PIZZA: A large flat tart made of bread dough spread with pieces of tomato, cheese, and shreds of meat, anchovies or the like, flavored with herbs, and baked thoroughly.

PIZZERIA: A restaurant or bakery where pizzas are made and sold.

PLATTER: A phonograph record.

PLUNGING NECKLINE: A very deep V-neckline in women's apparel.

PLUSH: Luxurious; over-elegant (as, a *plush* summer resort).

POLICE STATE: A totalitarian state having repressive government control of radio, press, culture, and economic and political life.

POLITIC: To campaign for political office; also, to seek to further a special end.

POLLEE: One who is questioned in or gives answers for a poll.

POLO SHIRT: A close-fitting pullover jersey or sport shirt of cotton knitwear, originally patterned after jerseys worn by polo players.

PONY TAIL: A hairdo for women, in which the hair is drawn back tightly from the face and up from the neck, and tied.

POODLE CUT: A very short, curly hairdo for women, in imitation of a poodle's coat.

POP: Short for *popular*;—used especially of music other than classical.

PORTAL-TO-PORTAL: Pertaining to the time a workman spends traveling from the portal or gate of company property to his actual place of work and in returning at the end of the work shift.

PREFAB: A prefabricated house or structure, construction of which consists merely of assembling and uniting standardized parts.

PRESSING: A phonograph record made from a matrix; also, the whole number of such recordings made at a single time.

PRESSURE GROUP: A minority group that brings pressure to bear on legislators or public opinion, often by lobbying or use of propaganda, to force legislation or change public policy.

- PRESSURE SUIT:** A suit worn by pilots flying at high altitudes, which inflates automatically when pressure inside the plane is lost.
- PRESSURIZE:** To maintain near-normal atmospheric pressure inside (the sealed cabin of an airplane) during high-level flight.
- PRIVATE EYE:** A private detective.
- PROFILE:** A vivid, concise biographical sketch; also, a concise analysis of any subject.
- PROXIMITY FUZE:** A device for making a projectile explode near the target.
- PSYCHODRAMA:** A spontaneous drama in which the actors exhibit their natural psychological reactions to a given situation, used especially in treating the mentally ill.
- PSYCHOMETRICS:** A branch of psychology that deals with the use and application of mental measurement; also, the technique of such measurement.
- PSYCHOSOMATIC:** Of or pertaining to the influence of mental factors on bodily disorders.
- PUBLIC RELATIONS:** The activities of a corporation, government, or other organization in building and maintaining good relations with the general public or with special groups.
- PUNCH CARD:** A data card with punched holes in particular places, each having an assigned significance, used in certain automatic business machines.
- PURGE:** To rid (a state or party) of members suspected of disloyalty.
- PUSHOVER:** An opponent easily defeated or a victim incapable of effective resistance; also, any problem presenting no real difficulties.
- QUARTERBACK:** To direct; to make plans and give instructions for carrying them out.
- QUICK-FREEZE:** To freeze (food) so rapidly that the natural juices and flavor are preserved.
- QUICKIE:** Anything hastily prepared or made; anything done without much preparation.
- RABBIT EARS:** A small indoor television antenna composed of two rods projecting upward from a ball-base in the form of a V.
- RACISM:** The assumption that certain races are naturally superior to others; also, any doctrine or program based on such an assumption.
- RADAR:** A powerful radio detecting device capable of establishing the distance, altitude, and direction of motion of any object in the path of its beam.
- RADIANT HEATING:** The heating of a house or room by heat radiated from large surfaces, such as floors, walls, or baseboards, that have first been warmed by heating coils or hot-air ducts.
- RADIATION SICKNESS:** An illness that results from exposure to radiation, as in radiotherapy or an atom bomb explosion.
- RANCH HOUSE:** A one-story dwelling, usually with an informal interior plan and a low-pitched roof.
- REACTOR:** An arrangement of fissionable material designed for the production and control of a chain reaction;—called also *nuclear reactor* and *pile*.
- RECESSION:** A slowing down of commercial and industrial activity, less severe than a depression; also, a period of such slackening.
- RECONVERSION:** The process of converting (especially a war plant) back to the production of civilian goods.
- RED-BAITER:** One who baits, attacks, or harasses communists or radicals.
- REFRESHER:** Providing reinstruction after a period of inactivity or instruction designed to keep one abreast of new developments in a field (as, a *refresher* course in auto mechanics).
- RESISTANCE:** An organized underground movement in a conquered country made up of groups of fighters engaged in sabotage and secret operations against occupation forces;—often with *the*.
- REV:** To raise or lower the number of revolutions per minute;—originally, of an airplane motor.
- Rh FACTOR:** A factor present in the red blood cells of 85 per cent of white persons (Rh-positive) and absent in 15 per cent (Rh-negative), so called because discovered in the blood of *Rhesus* monkeys. Rh incompatibility is manifested by red cell destruction and occurs when the two types are mixed in one person, especially as in the infant of an Rh-positive father and Rh-negative mother.
- RHUBARB:** A heated argument or dispute, often one that takes place on the field during a baseball game.
- RIBOFLAVIN:** Vitamin B₂, the growth-promoting substance of the vitamin-B group.
- RIGHTIST:** In politics, a member of the right; a conservative or royalist.
- ROBOT BOMB:** A small, pilotless jet-propelled airplane, steered by a gyroscopic device and loaded with explosives, that falls as an aerial bomb when its fuel supply is gone.
- ROC:** An aerial bomb with a television apparatus that transmits information back to the bombardier, who may then correct his initial aim by remote radio control.
- ROCKET SHIP:** An aircraft propelled by rocket power.
- ROLLER DERBY:** A form of sport in which teams on roller skates race around a track.
- ROTATION:** The military system of exchanging individuals or units assigned to combat or arduous duties with personnel more comfortably situated.
- RUMPUS ROOM:** A room in a home, often in the basement, set apart and suitably furnished for games and recreation.
- RUPTURED DUCK:** The symbol of an eagle with wings outspread depicted in the discharge emblem for personnel of the U. S. armed services.
- RUSSIAN ROULETTE:** A game or act of bravado in which the "player" puts one cartridge into a revolver, aims it at himself, spins the cylinder, and pulls the trigger.
- SATELLITE:** A state or country politically

- and economically dominated by a more powerful neighboring one.
- SCAN:** In radar, to cause (a certain area) to be traversed by a directive beam.
- SCARE BUYING:** Sudden buying, often involving an overstocking, of certain goods because of the fear that they may become scarce or unobtainable.
- SCHMOE or SCHMO, slang:** A stupid person; a misfit; a jerk.
- SCIENCE FICTION:** Imaginative or fantastic fiction, dealing especially with such subjects as life in the future, interplanetary travel, and life on other planets.
- SCRATCH TEST:** A test for determining susceptibility, made by rubbing an extract of the allergy-producing substance into the skin.
- SCREEN:** To pass through a standardized test for sorting out candidates according to abilities or eliminating the unfit; hence, to examine or select methodically.
- SCREWBALL:** Someone whose ideas or actions are crazy or fantastic; also, anything ridiculously absurd or zany.
- SCRIPTER:** A writer of scripts, as for movies, radio, or television.
- SEND:** In swing music, to perform with or inspire to spontaneous improvisations; also, to play so as to elate a listener.
- SHAKEOUT:** A moderate slowing down of commercial and industrial activity with a decrease in prices and employment, usually regarded as a readjustment toward normal after a period of inflation.
- SHARP, slang:** Conspicuously attractive; in keeping with the latest styles, as of clothing or speech.
- SHOCK THERAPY:** Treatment of mental disorders by means of a coma induced artificially by the administration of drugs or electric shock.
- SHOOTING WAR:** Conflict involving actual participation of armed forces in combat, as opposed to a war of nerves or a propaganda war.
- SHOPPING CENTER:** A group of retail stores or other business places, sometimes in one building, and usually provided with a large parking lot.
- SIGNATURE:** A tune or sound effect used to identify a particular radio program or feature;—called also *theme*.
- SILK SCREEN PROCESS:** A stencil method in which a design is made on a fine-mesh silk screen and transferred to another surface by forcing pigment through the screen with a squeegee.
- SIMULCAST:** A simultaneous broadcast of a program by radio and television; also, a program thus broadcast.
- \$64 QUESTION:** The most baffling question in a given situation, often one that defies direct answer.
- SKIP-STOP:** Not stopping at all points (as, *skip-stop* elevator or subway service).
- SKYSWEEPER:** A radar-aimed anti-aircraft weapon.
- SKYTYPING:** A technique, similar to skywriting, in which seven equally spaced aircraft emit puffs of smoke to form the letters of a message.
- SLICK or SLICK PAPER:** A large-circulation magazine printed on glossy paper;—usually implies slightness of content and technical smoothness.
- SMAZE:** A combination of smoke and haze.
- SMEAR:** To defame or blacken the reputation of a person or group by name-calling or by maliciously spreading exaggerated charges or rumors.
- SMEAR CAMPAIGN:** A concentrated program of vilification and smearing.
- SNACK BAR:** A counter or bar at which light refreshments and lunches are sold or served.
- SNEAK PREVIEW:** An unannounced showing of a new motion picture, usually to determine audience reaction to it.
- SNOLLYGOSTER:** A rascal or an unscrupulous person, especially an unprincipled politician.
- SNOW:** Small, moving, bright or dark spots on a television screen, resulting from the same causes as static in radio.
- SOAP OPERA:** A daytime radio or television serial drama performed on a commercial program chiefly for housewives.
- SOCIALIZED MEDICINE:** Administration by a government or other organized group of medical and hospital services for all members of a class or all members of the population.
- SONAR:** An apparatus that detects the presence and location of submarines or other underwater objects;—from sound navigation and ranging.
- SOUFFLÉ:** Tiny multicolored beads of glass or metal, used for embroidery.
- SOUND CONDITIONING:** The control of sound, as in an auditorium, by eliminating unwanted noise and excessive reverberations.
- SOUP UP:** To step up the horsepower of a motor, as on an airplane or a jalopy.
- SPACE:** Popularly, the region beyond the earth's atmosphere, lying between and beyond the planets and the stars.
- SPACE MEDICINE:** A suggested branch of medicine which would try to study conditions of outer space and their effect on the human body.
- SPACESHIP:** An imaginary aircraft for interplanetary travel.
- SPEECH CLINIC:** A clinic for the diagnosis and correction of speech disorders.
- SPELUNKER:** One whose hobby is exploring and studying caves and underground phenomena.
- SPIV, slang:** One who contrives to make a living without working; a slacker.
- SPLINTER GROUP:** In politics, a group broken away from a larger, original organization.
- SPLIT-LEVEL HOUSE:** A house built on different levels, usually with the floor level of a single-story section about midway between the floor levels of an adjoining two-story section.
- SPOTTER:** A civilian who watches the sky to report and identify approaching aircraft.
- STATELESS:** Without a state or nationality, as a person who was a citizen of a country no longer in existence.
- STATESIDE:** Of, pertaining to, characteristic of, or coming from the continental U. S.

- (as, a transfer from Alaska to *stateside* duty).
- STATIONARY FRONT:** In meteorology, a boundary between two air masses which show little or no movement.
- STATION BREAK:** In radio and television, the pause in a program or between programs to permit stations to identify themselves.
- STATION WAGON:** A sedanlike automobile having a tail gate and back seats that can be removed or folded so the vehicle can be used for light trucking.
- STATISM:** Government control or direction of important aspects of the economic life of a citizen.
- STEREOPHONIC:** Of reproduced sound, giving the effect of coming from two or more directions.
- STOCK CAR RACING:** Automobile racing in which ordinary cars are used rather than specially constructed racers.
- STOCKPILE:** A reserve supply of any essential material accumulated and stored as a safeguard against a shortage.
- STORM COAT:** A tailored winter coat for men or women, usually having a heavy lining and a mouton collar, and often made of gabardine.
- STRAWHAT CIRCUIT:** A summer theater circuit, often including the more popular resort areas.
- STREPTOMYCIN:** A substance extracted from certain soil bacteria and used against the bacteria of certain diseases, as typhoid fever, tularemia, and tuberculosis.
- SULFA:** Of or belonging to a class of drugs that are related to sulfanilamide and have a destructive action against certain types of bacteria.
- SUPERHIGHWAY:** A highway consisting of four or more lanes, designed for fast-moving traffic.
- SUPERMARKET:** A large, departmentalized retail store, usually self-service, selling foods and other household merchandise.
- SUPERSONIC:** Designating a speed greater than that of sound (about 738 miles per hour); also, moving or capable of moving at such speed (as, a *supersonic* aircraft).
- SWING SHIFT:** The work shift between the day and night shifts in a factory operating on a 24-hour basis, usually from 4 p.m. to midnight.
- SYNC:** In motion pictures and television, short for *synchronize* or *synchronization*.
- TAKE-HOME PAY:** The remainder of a person's gross wages after deductions, as for income-tax withholding, retirement, and union dues, have been made.
- TAPE:** A magnetized ribbon on which sounds may be recorded.—To record (sounds) on such a ribbon.
- TELECAMERA:** A television camera.
- TELECAST:** A program broadcast by television.—To broadcast by television.
- THEATER-IN-THE-ROUND:** A theater so arranged that the action area is in the center and the audience is seated on all sides of it;—called also *arena theater*.
- THERMONUCLEAR:** Pertaining to the heat energy resulting from or connected with changes in the nuclei of atoms.
- THIAMINE:** A vitamin, also known as *vitamin B₁*, that prevents beriberi and certain kinds of neuritis.
- THOUGHT CONTROL:** Repressive control or domination of individual ideas and thinking by another person or group.
- THREE-DIMENSIONAL or 3-D:** Giving the illusion of depth or varying distances;—applied to pictures, especially stereoscopic motion pictures.
- TONE ARM:** The movable part of a phonograph that contains the sound box or pickup and permits the needle to follow the grooves in the record.
- TOP-DRAWER:** Of the highest or first order of rank, excellence or importance.
- TRACE ELEMENT:** A chemical element, usually a metal, essential in minute amounts to the welfare of a plant or animal.
- TRACKMOBILE:** A lightweight tractor used for moving railroad cars in a switchyard.
- TRANSISTOR:** An electronic device similar in use to the electron tube.
- TWEEDY:** Given to or fond of wearing tweeds;—usually implying a certain matter-of-factness, robustness or informality of manner.
- TWEETER:** A small loudspeaker that responds only to high sound frequencies and is used to reproduce sounds of high pitch.
- 2,4-D:** A white crystalline compound used as a weed killer.
- ULTRAHIGH FREQUENCY or U.H.F.:** In radio and television, any frequency in the range from 300 to 3000 megacycles.
- VEEP:** A vice-president.
- VERY HIGH FREQUENCY or V.H.F.:** In radio and television, any frequency in the range from 30 to 300 megacycles.
- VIDEO:** *Television*. Pertaining to or used in sending or receiving the image (as, *video* frequency). Contrasted with *audio*.
- VIDEOCAST:** A television broadcast.
- VIP:** A very important person; sometimes, one using an assumed name for security reasons.
- WALKIE-LOOKIE:** A portable, battery-operated television camera.
- WALKIE-TALKIE:** A compact, battery-operated transmitting and receiving radiotelephone that is carried like a knapsack and especially adapted for communication in the field.
- WATER SKIS:** Wide skis towed by a fast motorboat and ridden like a surfboard.
- WEEDICIDE:** Any weed killer, especially a chemical one, as 2,4-D.
- WELFARE STATE:** A state that, by its concern with public health, insurance against sickness and unemployment, and similar measures, assumes a large share of responsibility for the welfare of its citizens.
- WETBACK:** A person who enters the U. S. illegally from Mexico by wading or swimming the Rio Grande River.
- WHAMMY:** A curse or jinx (as, to put the *whammy* on a person).
- WITCH-HUNT:** A searching out of victims, especially liberals, professedly to expose them as disloyal or subversive, but actually to harass them for political reasons.

WOOFER: A loudspeaker, larger than a tweeter, that responds only to lower sound frequencies.

ZOOT SUIT: A suit of extreme cut, usually having a long jacket with broad shoulders, and high-waisted peg-top trousers.

Forms of Address

Reprinted by permission. From Webster's New International Dictionary, Second Edition, copyright, 1934, 1939, 1945, 1950, 1953, 1954, by G. & C. Merriam Company.

Abbot. Address: The Right Reverend _____, Abbot of _____. Begin: Right Reverend and dear Father.

Alderman. Address: Honorable _____. Begin: Dear Sir.

Ambassador. Address: His Excellency, _____, Ambassador of _____ at _____. Begin: Sir; or Excellency.

Ambassador and his wife. Address: His Excellency, The _____ Ambassador and Mrs. _____. Begin: Your Excellencies.

Archbishop (Anglican). Address: The Most Reverend His Grace the Lord Archbishop of _____. Begin: My Lord Archbishop; or Your Grace.

Archbishop (Roman Catholic). Address: The Most Reverend _____, D.D., Archbishop of _____. Begin: Your Excellency.

Archdeacon. Address: The Venerable The Archdeacon of _____. Begin: Venerable Sir.

Army Officers. Address: The Commander in Chief, Army of the U. S.; or (use officer's rank) _____. U.S.A. Begin: Sir; or My dear General _____.

Assemblyman. Address: The Honorable _____, Member of Assembly; or Assemblyman _____. Begin: Sir; or My dear Mr. _____.

Assistant Secretary (Assistant to a Cabinet Officer). Address: Honorable _____, Assistant Secretary of _____. Begin: Sir; or Dear Mr. _____.

Associate Justice. Address: The Honorable _____, United States Supreme Court; or Mr. Justice _____. The Supreme Court. Begin: Mr. Justice; or Dear Justice.

Baron. Address: The Right Honourable Lord _____; or The Lord _____. Begin: My Lord.

Baroness. Address: The Right Honourable the Baroness _____; or The Lady _____. Begin: Madam.

Baronet. Address: Sir John _____. Bt. or Bart. Begin: Sir.

Baronet's wife. See Lady, below.

Baron's wife. See Baroness, above.

Bishop (Anglican). Address: The Right Reverend the Lord Bishop of _____. or The Lord Bishop of _____. Begin: My Lord Bishop; or My Lord.

Bishop (Methodist). Address: Reverend Bishop _____. Begin: Dear Sir; or My dear Bishop _____.

Bishop (Protestant Episcopal). Address: To the Right Reverend _____, Bishop of _____. Begin: Right Reverend and Dear Sir; or Dear Bishop _____.

Bishop (Roman Catholic). Address: The Most Reverend _____, Bishop of _____. Begin: Your Excellency; or Most Reverend Sir.

Cabinet Officers (U. S.). Address: The Honorable the Secretary of State (or Labor, etc.); The Secretary of State, etc. Begin: Sir; or My dear Mr. Secretary.

Canon. Address: The Very Reverend Canon _____; or The Very Reverend _____, Canon of _____. Begin: Very Reverend Canon; or Dear Canon _____.

Cardinal. Address: His Eminence John, Cardinal _____. Begin: Your Eminence.

Cardinal (if also an Archbishop). Address: His Eminence _____, Cardinal _____, Archbishop of _____. Begin: Your Eminence.

Chargé d'Affaires. Address: The Chargé d'Affaires of _____. or _____, Esq., Chargé d'Affaires. Begin: Dear Sir; or My dear Mr. _____.

Chief Justice of the U. S. Address: The Chief Justice of the U. S.; or The Chief Justice, The Supreme Court, Washington, D. C. Begin: My dear Mr. Chief Justice; or Sir.

Clergyman. Address: The Reverend _____; or (if doctor of divinity) The Rev. Dr. _____. Begin: Dear Sir; or Reverend Sir.

Clerk of Senate or House. Address: The Honorable _____, Clerk of _____. Begin: Sir; or Dear Sir.

Commissioner of Bureau. Address: The Honorable _____, Commissioner of the Bureau of _____. Begin: Sir; or Dear Sir.

Congressman. Address: Honorable James H. Smith, House of Representatives. Begin: Sir; or Dear Sir.

Consul. Address: To the American Consul at _____; or _____, Esq., American Consul at _____. Begin: Dear Sir.

Countess. Address: To the Right Honourable The Countess of _____. Begin: Madam.

Dame. Address: Dame _____. Begin: Madam.

Deacon. (Anglican and Protestant Episcopal). Address: The Reverend Deacon _____. Begin: Reverend Sir.

Dean (Ecclesiastical). Address: The Very Reverend the Dean of _____. Begin: Very Reverend Sir; or Sir.

Dean, Rural (Roman Catholic Church). Address: The Very Reverend _____, R.D., or V.F. Begin: Very Reverend Father.

Dean of a College or Graduate School. Address: Dean _____. Begin: Dear Sir; or Dear Dean _____.

Divorced woman. Address: Ordinarily use the maiden name with Mrs. Some divorced women prefer to resume the Miss.

Doctor of Divinity. Address: _____, D.D.; or Rev. Dr. _____. Begin: Dear Sir; or Dear Dr. _____.

Doctor of Philosophy, Laws, Medicine, etc. Address: _____, Ph.D. (LL.D.) (M.D.); or Dr. _____. Begin: Dear Sir; or Dear Dr. _____.

Dowager. See *Widow*, below.

Duchess. Address: Her Grace the Duchess of _____; or The Most Noble the Duchess of _____. Begin: Madam; or Your Grace;

Duchess of the Blood Royal. Address: Her Royal Highness The Duchess of _____. Begin: Madam; or May it please your Royal Highness.

Duke. Address: His Grace the Duke of _____; or The Most Noble the Duke of _____. Begin: My Lord Duke; or Your Grace.

Duke of the Blood Royal. Address: His Royal Highness The Duke of _____. Begin: Sir; or May it please your Royal Highness.

Earl. Address: The Right Honourable The Earl of _____; or The Earl of _____. Begin: My Lord.

Earl's wife. See *Countess*, above.

Envoy. Same as Minister (Diplomatic).

Esquire. Address: _____, Esq. Begin: Sir; or Dear Mr. _____. (Note.—Esq. is never used if the person is addressed by any other title, even Mr.)

Governor. Address: (In Mass. and by courtesy in some other states) His Excellency, The Governor of _____; or His Excellency _____; or (in other states of the U. S.) The Honorable the Governor of _____; or Hon. _____, Governor of _____. Begin: Sir; or Dear Sir.

Governor-General of Canada. Address: His Excellency The Right Honourable _____, (plus rank or title, if any). Begin: My Lord; or Sir.

Governor-General's wife. Address: Her Excellency _____. Begin: Madam.

Judge (U.S.A.). Address: The Honorable _____, U. S. District Judge. Begin: Dear Sir; or My dear Judge _____.

King. Address: The King's Most Excellent Majesty; or His Most Gracious Majesty, King _____. Begin: Sir; or May it please your Majesty.

King's Counsel. Address: To _____, Esq., K.C. Begin: Sir.

Knight. Address: Sir John _____ (initials of his order, if any, as K.C.B.). Begin: Sir.

Knight's wife. See *Lady*, below.

Lady. Address: Lady _____, or (if daughter of a baron or viscount) Hon. Lady _____; or (if the daughter of an earl, marquis, or duke) Lady Florence _____. Begin: Madam; or Your Ladyship.

Lawyer. Address: _____, Esq.; or Mr. _____, Attorney at Law. Begin: Dear Sir; or My dear Mr. _____.

Lieutenant Governor. Address: The Honorable _____, Lt. Governor of _____. Begin: Sir; or Dear Sir.

Maid of Honor. Address: The Honourable Miss _____. Begin: Madam.

Marchioness. Address: The Most Honourable the Marchioness of _____. Begin: Madam.

Marquis. Address: The Most Honourable the Marquis of _____; or The Marquis of _____. Begin: My Lord Marquis.

Mayor (in Canadian cities and towns, and English boroughs). Address: The Right Worshipful the Mayor of _____ (English); His Worship, The Mayor of _____ (Canadian). Begin: Sir.

Mayor (in the U. S.). Address: The Honorable _____, Mayor of _____; or The Mayor of the City of _____. Begin: Sir; or Dear Mr. Mayor.

Member of Parliament (or of a Provincial Legislative Council or Legislature, etc.) To the ordinary form of address add M.P. (or M.P.P.; or M.L.A., etc.). Begin: Sir.

Minister (Diplomatic). Address: The Honorable _____, Minister of _____. Begin: Sir; or My dear Mr. Minister.

Minister (Religious). See *Clergyman*, above.

Moderator (Presbyterian Church). Address: The Right Reverend _____. Begin: Right Reverend Sir.

Monsignor. Address: The Right Reverend Monsignor _____. Begin: Right Reverend and dear Monsignor.

- Mother Superior of a Sisterhood.** Address: The Reverend Mother Superior, Convent of _____; or Reverend Mother _____, O.S.D. (or other initials of the order). *Begin:* Reverend Mother; or Dear Madam.
- Naval Officers.** Address: The Admiral of the Navy of the U. S.; or Captain _____, U.S.N. *Begin:* Sir; or Dear Commander _____; but for officers below the rank of commander, Dear Mr. _____.
- Nun.** See *Sister of a Religious Order*, below.
- Papal Nuncio or Internuncio or Apostolic Delegate.** Address: His Excellency, The Papal Nuncio (or Internuncio or Apostolic Delegate) to _____. *Begin:* Your Excellency.
- Patriarch (Eastern Church).** Address: His Beatitude the Patriarch of _____; or His Beatitude the Lord _____, Patriarch of _____. *Begin:* Most Reverend Lord; or Your Beatitude.
- Pope.** Address: To His Holiness Pope _____. *Begin:* Most Holy Father; or Your Holiness.
- President of a College or University.** Address: _____, LL.D. (or if he is not an LL.D., use the initials of his highest degree), President of _____ University; or President, _____ University. If he is a clergyman, address as Reverend _____. *Begin:* Dear Sir; or Dear President _____.
- President of a Theological Seminary.** Address: The Rev. President _____. *Begin:* Dear Sir; or Dear President _____.
- President of State Senate.** Address: The Honorable _____, President of the Senate of _____. *Begin:* Sir.
- President of the Senate of the U. S.** Address: The Honorable, The President of the Senate of the U. S.; or The Honorable _____, President of the Senate. *Begin:* Sir.
- President of the U. S.** Address: The President, The White House; or His Excellency, The President of the U. S. *Begin:* Mr. President; or The President; or My dear Mr. President.
- Priest (Roman Catholic Church).** Address: Reverend _____, O.S.M. (or other initials of his order). *Begin:* Dear Father _____ (religious name).
- Prime Minister of Canada.** Address: The Right Honourable _____, P.C., Prime Minister of Canada. *Begin:* Sir.
- Prince of the Blood Royal.** Address: His Royal Highness Prince _____. *Begin:* Sir.
- Prince of Wales.** Address: His Royal Highness The Prince of Wales. *Begin:* Sir; or May it please your Royal Highness.
- Princess of the Blood Royal.** Address: Her Royal Highness the Princess _____ (Christian name). *Begin:* Madam.
- Privy Councillor (British Imperial).** Address: To the Right Honourable _____, P.C. *Begin:* Sir. Note.—If other titles are used, they should come after *The Right Honourable*; as, The Right Honourable Sir John _____.
- Privy Councillor (of Canada).** Address: The Honourable _____. *Begin:* Sir.
- Professor in a College or University.** Address: Professor _____, or _____, Ph.D. (or LL.D., M.D., etc., using only the initials of his highest degree, if the degrees are in the same field), Professor of _____. *Begin:* Dear Sir; or My dear Professor.
- Professor in a Theological Seminary.** Address: The Reverend Professor _____. *Begin:* Dear Sir; or Dear Professor _____.
- Queen.** Address: The Queen's Most Excellent Majesty; or Her Gracious Majesty, The Queen. *Begin:* Madam; or May it please your Majesty.
- Queen Mother.** Address: Her Gracious Majesty Queen _____. *Begin:* Madam; or May it please your Majesty.
- Rabbi.** Address: Rabbi _____. *Begin:* Reverend Sir; or My dear Rabbi _____. (If he holds a doctor's degree, Dr. may be substituted for Rabbi.)
- Rector of a Religious House or of a Seminary.** Address: The Very Reverend _____, O.S.B. (or other initials of order), Rector, Brothers of St. Francis. *Begin:* Very Reverend and dear Father (or Brother).
- Representative.** See *Congressman*, above.
- Senator (U. S.)** Address: The Honorable _____, the U. S. Senate, Washington, D. C. *Begin:* Dear Sir; or My dear Senator.
- Sister of a Religious Order.** Address: Sister _____, (followed by the initials of the order). *Begin:* Dear Sister; or My dear Sister _____.
- Speaker of the House of Commons (Canada).** Address: The Honourable _____, The Speaker of the House of Commons. *Begin:* Dear Mr. Speaker.
- Speaker of the House of Representatives of the U. S.** Address: The Honorable _____, Speaker of the House of Representatives. *Begin:* Sir; or My dear Mr. Speaker.
- State Senator.** Like Senator (U. S.).
- Undersecretary of State (U.S.A.).** Address: The Undersecretary of State; or The Honorable _____, Undersecretary of State. *Begin:* Sir; or Dear Mr. _____.
- Vice-President.** Address: The Vice-President; or The Honorable _____, Vice-President of the U. S. *Begin:* Mr. Vice-President; or Sir.
- Viscount.** Address: The Right Honourable the Viscount _____. *Begin:* My Lord.
- Viscountess.** Address: The Right Honourable the Viscountess _____. *Begin:* Madam.
- Widow.** Address: Ordinarily address by her former title; as, Mrs. John Smith, not Mrs. Mary Alice Smith, unless the latter form is preferred by the person herself.

THE UNITED STATES

STATES, TERRITORIES AND CITIES

(State flower, bird, etc. are official unless otherwise indicated; dates in parentheses are those of adoption. Area is total of land and inland water. Estimated population figures for 1956 are as of July 1 and are provisional. Largest cities include incorporated places only.)

ALABAMA

Capital: Montgomery.
Governor: James E. Folsom, Dem. (to Jan. 1959).
Organized as territory: Mar. 3, 1817.
Entered Union & (rank): Dec. 14, 1819 (22).
Seceded from Union: Jan. 11, 1861.
Re-entered Union: July 13, 1868.
Present constitution adopted: 1901.
Motto: *Audemus jura nostra defendere* (We dare defend our rights).
State flower: Goldenrod (1927).
State bird: Yellowhammer (1927).
State song: "Alabama" (1931).
Nickname: Yellowhammer State.
Origin of name: Disputed. May come from Choctaw meaning "thicket-clearers" or "vegetarian-gatherers."
1940 population & (rank): 2,832,961 (17).
1950 population & (rank): 3,061,743 (17).
1956 estimated population: 3,135,000.
Area & (rank): 51,609 sq. mi. (28).
Geographic center: In Chilton Co., 12 mi. SW of Clanton.
Number of counties: 67.
Largest cities (1950 Census): Birmingham (326,037); Mobile (129,009); Montgomery (106,525); Gadsden (55,725); Tuscaloosa (46,396).
State forests: 6 (14,248.58 ac.).
State parks: 34 (39,619.6 ac.).
State general revenue (1955-56): \$324,652,145.
State general expenditure (1955-56): \$349,371,996.

Alabama is the leading heavy-industry state in the South. Textiles, iron and steel, and sawmill products lead its manufacturing, which centers around the "Pittsburgh of the South"—Birmingham. Industry is growing rapidly in other areas, including the Tennessee River Valley, with its great Muscle Shoals power plant. Lumber, marble, dolomite and petroleum are other important products. Alabama ranks high in the production of cotton, cattle, corn, hay, nuts, broiler chickens and sweet potatoes.

At Tuskegee Institute, founded by Booker T. Washington, Dr. George Washington Carver carried out his famed agricultural research.

The Confederacy was founded at Montgomery in Feb. 1861, and for a time the city was the Confederate capital.

In 1540, Hernando de Soto and his treasure seekers were the first white men to see the state, although Cabeza de Vaca may have preceded him in 1528.

ARIZONA

Capital: Phoenix.
Governor: Ernest W. McFarland, Dem. (to Jan. 1959).
Organized as territory: Feb. 24, 1863.
Entered Union & (rank): Feb. 14, 1912 (48).
Present constitution adopted: 1911.
Motto: *Ditat Deus* (God enriches).
State flower: Flower of saguaro cactus (1931).
State bird: Cactus wren (1931).
State colors: Blue and old gold (1915).
State song: "Arizona," a march song (1919).
State tree: Palo Verde (1957).
Nickname: Grand Canyon State.
Origin of name: From the Indian "Arizonac," meaning "little spring."
1940 population & (rank): 499,261 (43).
1950 population & (rank): 749,587 (37).
1956 estimated population: 1,080,000.
Area & (rank): 113,909 sq. mi. (5).
Geographic center: In Yavapai Co., 55 mi. SE of Prescott.
Number of counties: 14.
Largest cities (1950 Census): Phoenix (106,818); Tucson (45,454); Mesa (16,790); Douglas (9,442); Yuma (9,145).
State forests: None.
State parks: None.
State revenue (1955-56): \$189,727,473.
State expenditure (1955-56): \$182,383,245.

Agriculture is Arizona's largest revenue-producing industry. By means of irrigation, its once arid acres produce alfalfa, cotton, wheat, sorghum, vegetables, citrus fruits and dates. Income from livestock ranks high from both range and feeder cattle.

Mining of copper, gold, vanadium, uranium and silver ranks next among the industries, the production of copper exceeding that of any other state. Smelting and refining are leading activities.

Phoenix, its largest city, is both a popular health resort and a busy shipper of cotton and vegetables. Douglas loads cattle and smelts copper.

With the Hopi, Navajo (the largest in numbers) and Apache tribes, Arizona has the largest U. S. Indian population, spread over fourteen reservations. It also has some of the country's most famous scenery. In the north is the Grand Canyon; in the east are located the Petrified Forest and Painted Desert.

Marcos de Niza, a Franciscan friar, entered the state in 1539 in search of the mythical Seven Cities of Cibola, and was followed a year later by Coronado.

ARKANSAS

Capital: Little Rock.
 Governor: Orval Faubus, Dem. (to Jan. 1959).
 Organized as territory: Mar. 2, 1819.
 Entered Union & (rank): June 15, 1836 (25).
 Seceded from Union: May 6, 1861.
 Re-entered Union: June 22, 1868.
 Present constitution adopted: 1874.
 Motto: *Regnat populus* (The people rule).
 State flower: Apple Blossom (1901).
 State tree: Pine (1939).
 State bird: Mockingbird.
 State song: "The Arkansas Traveler" (1949).
 Nickname: Land of Opportunity.
 Origin of name: From the Quapaw Indians.
 1940 population & (rank): 1,949,387 (24).
 1950 population & (rank): 1,909,511 (30).
 1956 estimated population: 1,815,000.
 Area & (rank): 53,102 sq. mi. (26).
 Geographic center: In Pulaski Co., 12 mi. N of W of Little Rock.
 Number of counties: 75.
 Largest cities (1950 Census): Little Rock (102,213); Fort Smith (47,942); North Little Rock (44,097); Pine Bluff (37,162); Hot Springs (29,307).
 State forests: None.
 State parks: 11 (18,380 ac.).
 State general revenue (1951): \$101,207,000.
 State general expenditure (1951): \$99,000,000.

About 90 per cent of the nation's bauxite—the source of aluminum—comes from the earth of Arkansas, which also contains North America's only known diamond mine, located in Pike County near Murfreesboro, and presently used as a tourist attraction on a "finders-keepers" basis.

The state is almost equally divided between mountains and delta areas. Arkansas has an equable southern climate and fertile central valleys which grow cotton, rice, wheat, corn, oats, potatoes and fruit. Other industries are oil production, lumbering and production of whetstones and antimony ore.

Hot Springs entertains fifteen times its population in guests each year. Its forty-seven famous curative mineral springs, the only ones administered by the Federal Government, are in Hot Springs National Park in the Ouachita Mountains. Pine Bluff has the largest archery factory in the country.

CALIFORNIA

Capital: Sacramento.
 Governor: Goodwin J. Knight, Rep. (to Jan. 1959).
 Entered Union & (rank): Sept. 9, 1850 (31).
 Present constitution adopted: 1879.
 Motto: *Eureka* (I have found it).
 State flower: Golden poppy (1903).
 State tree: California redwoods (*Sequoia sempervirens* & *Sequoia gigantea*) (1937 & 1953).
 State bird: California valley quail (1931).
 State animal: California grizzly bear (1953).
 State fish: California golden trout (1947).
 State insect: California dog-face butterfly (unofficial).
 State colors: Blue and gold (1951).
 State song: "I Love You, California" (1951).
 Nickname: Golden State.
 Origin of name: From a book, *Amadis de Gaula*, by Garcia Ordóñez de Montalvo, c. 1500.

1940 population & (rank): 6,907,387 (5).
 1950 population & (rank): 10,586,223 (2).
 1956 estimated population: 13,600,000.
 Area & (rank): 158,693 sq. mi. (2).
 Geographic center: In Madera Co., 35 mi. NE of Madera.
 Number of counties: 58.
 Largest cities (1950 Census): Los Angeles (2,104,663); San Francisco (798,000); Oakland (397,000); San Diego (434,924); Long Beach (262,000).
 State forests: 8 (70,235 ac.).
 State parks and beaches: 147 (600,000 ac.).
 State general revenue (Est. 1956-57): \$1,840,378,000.
 State general expenditure (Est. 1956-57): \$1,828,385,000.

California earns more money from raising food and catching fish than any other state, and it stands high in oil production, lumbering and manufacturing. It has more motor vehicles than any other state or any foreign country. Out-of-state tourist visitors and the travel and recreation expenditures of the state's residents continue to play an important part in the expansion of trade and employment opportunities. Irrigation makes possible the production of more than 200 commercial crops.

Nature is spectacular. Death Valley, in the southeast, is 282 feet below sea level, the lowest spot in the nation; Mt. Whitney, a 14,495-foot peak, is the highest point in the U. S.; Lassen Peak is the only active U. S. volcano although its last eruptions were recorded in the years from 1914 to 1917; and the General Sherman Tree in Sequoia National Park is estimated to be about 3,500 years old. San Pedro is the world's largest man-made harbor, and the Bank of America National Trust and Savings Association, operated and owned by the Giani-nini family, is the largest privately owned bank in the world.

Gold, which was responsible for the state's settlement boom, is still found here, but the state's most important mineral products today are oil, natural gas and natural gas liquids, cement, liquefied petroleum gases, miscellaneous stones, salines, iron ore and tungsten.

California is a leader in electrical energy, and its cities specialize in airplane making, lumber and wood products, printing and publishing, apparel and machinery manufacturing, motor-vehicle production and food processing.

California's 4 national parks are great tourist attractions, and the San Francisco-Oakland and Golden Gate bridges are among the world's engineering marvels.

Juan Rodríguez Cabrillo, Portuguese navigator, was probably the first white man to see the state in 1542.

COLORADO

Capital: Denver.
 Governor: Stephen L. R. McNichols, Dem. (to Jan. 1959).
 Organized as territory: Feb. 28, 1861.
 Entered Union & (rank): Aug. 1, 1876 (38).

Present constitution adopted: 1876.

Motto: *Nil sine Numine* (Nothing without Providence).

State flower: Rocky Mountain columbine (1899).

State tree: Colorado blue spruce (1939).

State bird: Lark bunting (1931).

State colors: Blue and white (1911).

State song: "Where the Columbines Grow" (1915).

Nickname: Centennial State.

Origin of name: From the Spanish, meaning "red."

1940 population & (rank): 1,123,296 (33).

1950 population & (rank): 1,325,089 (34).

1956 estimated population: 1,612,000.

Area & (rank): 104,247 sq. mi. (7).

Geographic center: In Park Co., 30 mi. NW of Pikes Peak.

Number of counties: 63.

Largest cities (1950 Census): Denver (415,786);

Pueblo (63,685); Colorado Springs (45,472);

Greeley (20,354); Boulder (19,999).

State forests: 1 (70,980 ac.).

Total state revenue (1956): \$277,995,340.

Total state expenditure (1956): \$273,149,498.

Colorado, the most elevated state in the nation, with 54 of its peaks over 14,000 feet in height and more than 1,000 going beyond the 10,000-foot mark, began as a miner of gold but has been predominantly agricultural in recent times. Livestock, wheat, hay, beans, sugar beets, corn, potatoes, barley and truck vegetables head the crop list. Like California and Arkansas, the state has a highly developed irrigation system to counteract its dry climate and promote farming.

Colorado is one of the nation's largest producers of uranium and vanadium; also mined are gold, silver, lead, zinc, copper, molybdenum, coal and several nonmetals. The state is also a leading oil producer.

Pueblo, the "Pittsburgh of the West," makes iron, steel, brick, tile and foundry products. Colorado Springs is perhaps the most popular tourist center in the Rocky Mountain sector. Mount Evans Highway is the highest auto road in North America. The world's highest suspension bridge stretches 1,053 feet over the Royal Gorge of the Arkansas River. Summit Lake, 12,740 feet high, near the top of Mt. Evans, is the highest lake in the U. S. reached by an auto road.

Of archeological interest are the cliff dwellings in the southwestern part of the state.

Coronado entered the state in 1540.

CONNECTICUT

Capital: Hartford.

Governor: Abraham A. Ribicoff, Dem. (to Jan. 1959).

Entered Union & (rank): Jan. 9, 1788- (5).

Present constitution adopted: 1818; revised effective 1955.

Motto: *Qui transtulit sustinet* (He who transplanted still sustains).

State flower: Mountain laurel (1907).

State tree: White oak (1947).

State bird: American robin (1943).

State song: None.

Nicknames: Constitution State; Nutmeg State; Land of Steady Habits.

Origin of name: From an Indian word meaning "beside the long tidal river."

1940 population & (rank): 1,709,242 (31).

1950 population & (rank): 2,007,280 (28).

1957 estimated population: 2,362,000.

Area & (rank): 5,009 sq. mi. (46).

Geographic center: In Hartford Co., at East Berlin.

Number of counties: 8.

Largest cities (1950 Census): Hartford (177,397); New Haven (164,443); Bridgeport (158,709); Waterbury (104,477); Stamford (74,293).

State forests: 26.

State parks: 72.

State general revenue (1956): \$259,366,000.

State general expenditure (1956): \$324,097,000.

Connecticut earned its sobriquet, the "Arsenal of the Nation," by its ability to turn out firearms and ammunition in early days, and from this developed an ability to turn out precision instruments of all classes.

Connecticut's cities produce a variety of products, some of which are: arms, sewing machines, airplanes, typewriters, motors, hardware, cutlery, tools, clocks, locks, pottery, machinery, brass products and hats. Hartford, which has the oldest U. S. newspaper, the *Courant*, established in 1764, is the insurance capital of the nation.

Connecticut devotes its farmland mainly to dairying, fruit growing and poultry raising. It stands high in tobacco growing and no crop in the nation receives as high a price per acre as her shade-grown tobacco.

The state is a popular resort area both for its beaches on Long Island Sound and for its inland lakes and forested hills. The southwest part of the state is a suburban area of New York City.

Connecticut was the first state to have a written constitution, the *Fundamental Orders*, adopted by three original towns of Colonial days in Jan. 1639.

DELAWARE

Capital: Dover.

Governor: J. Caleb Boggs, Rep. (to Jan. 1961).

Entered Union & (rank): Dec. 7, 1787 (1).

Present constitution adopted: 1897.

Motto: Liberty and independence.

State colors: Colonial blue and buff.

State flower: Peach blossom.

State tree: American holly.

State bird: Blue hen chicken.

State song: "Our Delaware."

Nicknames: Diamond State; Blue Hen State; First State.

Origin of name: In honor of Sir Thomas West, Lord De La Warr.

1940 population & (rank): 266,505 (46).

1950 population & (rank): 318,085 (46).

1956 estimated population: 402,000.

Area & (rank): 2,399.2 sq. mi. (47).

Geographic center: In Kent Co., 11 mi. S of Dover.

Number of counties: 3.

Largest cities (1950 Census): Wilmington (110,356); Newark (6,731); Dover (6,223);

New Castle (5,396); Elsmere (5,314).

State forests: 5 (4,709 ac.).

State parks: 3.

State general revenue (1956): \$50,071,701.

State general expenditure (1956): \$45,338,576.

Little Delaware, at the lowest mean elevation of any state, grows a great variety of small fruit and vegetables and is a U. S. pioneer in the industry of food canning. Peaches, strawberries, apples, corn, wheat, lima beans, asparagus, tomatoes and hay are the leading crops. Fishing in the bay is an important industry. Delaware's chicken farms are one of the great supply sources for the big markets of the East.

Manufactures in Delaware include chemicals, vulcanized fiber, glazed kid and morocco leathers, textiles, paper, dental supplies, metal products, machinery, machine tools and transportation equipment of every major type. In 1844, the *Bangor*, the first iron seagoing propeller-type vessel constructed in the U. S., was launched at Wilmington.

Delaware was the first state to ratify the U. S. Constitution, on Dec. 7, 1787. During the Civil War, although a slave state, Delaware refused to secede from the Union; the southern part of the state, however, supplied many supporters to the Confederacy.

Henry Hudson discovered Delaware Bay in his exploration of 1609. First settlers in the state were Dutchmen, who arrived in 1631, but who were shortly afterwards massacred by the Indians.

DISTRICT OF COLUMBIA

(City of Washington)

Land ceded to Congress: 1788 by Maryland; 1789 by Virginia (retroceded to Virginia Sept. 7, 1846).

Seat of government transferred to D. C.: Dec. 1, 1800.

Created municipal corporation: Feb. 21, 1871.

Present form of government established: June 11, 1878.

President of Board of Commissioners: Robert E. McLaughlin.

Motto: *Justitia omnibus* (Justice to all).

Official flower: American beauty rose.

Origin of name: In honor of Columbus.

1940 population & (rank as city): 663,091 (11).

1950 population & (rank as city): 802,178 (9).

1956 estimated population: 859,000.

Area: Land, 60.41 sq. mi.; inland water, 7.84.

Geographic center: Near corner of Fourth and L Sts., NW.

Altitude: Highest, 420 ft.; lowest, sea level.

Location: Between Virginia and Maryland, on Potomac River.

Churches: Protestant, 428; Roman Catholic, 40; Jewish, 21; others, 21.

City parks: 780 (6,945.5 ac.).

Telephones (Mar. 1, 1956): 553,507.

Radio sets: 250,400.

Television sets: 227,400.

Radio stations: AM, 7; FM, 8.

Television stations: 4.

Assessed valuation (June 30, 1957): \$3,216,205,-213.

City tax rate (1956): \$2.30 per \$100.

Bonded debt (1956): None.

Revenue (1956): \$193,096,532.

Expenditures (1956): \$184,777,845.

The District of Columbia—identical with the City of Washington—is the capital of the U. S. and the first carefully planned capital in the world.

D. C. history began in 1790 when Congress directed selection of a new capital site, 10 miles square, along the Potomac. When the site was determined, it included thirty and three-quarters square miles on the Virginia side of the river. In 1846, however, Congress returned that area to Virginia.

President Washington had commissioned Major Pierre L'Enfant, a French engineer who had fought in the Revolution, to plan the new capital and in 1800 the government moved in. In 1814, during the War of 1812, a British force fired the capital and it was from the white paint applied to cover fire damage that the President's home came to be called the White House.

Washington's skyline is dominated by the Capitol and the Washington Monument, towering 555 feet. The Capitol, while not in the city center, is the key to the street address system. The city is laid out in rectangular blocks, created by streets intersecting at right angles. In addition, diagonal arteries fan out from various centers. Pennsylvania Avenue—the radial lines are generally named for the states—is the most famous of them, with the White House at number 1600.

The Capitol is 751 feet long and 350 feet wide. It has 431 rooms. The two wings, constructed of marble, house the Senate and the House; and the central part of the building contains the Rotunda, the Statuary Hall and the old Supreme Court chamber. Visitors may go through the building from 9 a.m. until 4:30 p.m. Congress normally convenes at noon, and the floor of the Senate and House must be cleared by 11:45 a.m. The galleries in the Senate and House chambers are open to visitors during sessions.

Washington has many other famous buildings and monuments—the Library of Congress, Jefferson Memorial, Lincoln Memorial, Grant Memorial, Tomb of the Unknown Soldier (Arlington Cemetery), Treasury Building, the Pentagon, Petersen House (where Lincoln died) and scores of others.

Washington is administered by three commissioners appointed by the President. Two of them must be residents of the District of Columbia and the third must be a U. S. Army engineer appointed by the Chief of Engineers.

FLORIDA

Capital: Tallahassee.

Governor: LeRoy Collins, Dem. (to Jan. 1961).

Organized as territory: Mar. 30, 1822.

Entered Union & (rank): Mar. 3, 1845 (27).

Seceded from Union: Jan. 10, 1861.

Re-entered Union: June 25, 1868.

Present constitution adopted: 1885.

Motto: In God we trust.

State flower: Orange blossom (1909).

State bird: Mockingbird (1927).

State song: "Swanee River" (1935).

Nickname: Sunshine State.

Origin of name: From the Spanish, meaning "feast of flowers" (Easter).

1940 population & (rank): 1,897,414 (27).

1950 population & (rank): 2,771,305 (20).

1956 estimated population: 3,770,000.

Area & (rank): 58,666 sq. mi. (21).
 Geographic center: In Citrus Co., 12 mi. W of N of Brooksville.
 Number of counties: 67.
 Largest cities (1950 Census): Miami (249,276); Jacksonville (204,517); Tampa (124,681); St. Petersburg (96,738); Orlando (52,367).
 State forests: 4 (204,035 ac.).
 State parks: 23 (74,936 ac.).
 State general revenue (1953): \$278,479,314.
 State general expenditure (1953): \$220,374,511.

Agriculture is Florida's biggest steady pursuit, but hotel statistics point to its chief fame—resort and tourist business. Along its coastline, the longest of any state, dozens of communities more than double in population during the winter season when northerners flee snow and cold.

Oranges and grapefruit lead Florida's crop list, then come tomatoes, tobacco, beans, celery, potatoes and field corn. Truck gardening, commercial fishing and cattle are leading industries. Deep-sea fishing for sport is a leading tourist hobby. Industry is becoming increasingly important, with metal-working and chemicals now added to lumber, paper and citrus processing. Tampa is one of the largest cigar manufacturers and Jacksonville ships lumber and turpentine.

Florida's low elevation is dotted by some 30,000 small lakes and the Everglades National Park in the south. St. Augustine, founded in 1565, is the oldest town of European origin in the U. S. Key West, exclusive resort city, is the southernmost city in the U. S. and is connected to the mainland by a unique causeway.

In 1513, Ponce de León, seeking the mythical "Fountain of Youth," was the first white man to see the state.

GEORGIA

Capital: Atlanta.
 Governor: Samuel Marvin Griffin, Dem. (to Jan. 1959).
 Entered Union & (rank): Jan. 2, 1788 (4).
 Seceded from Union: Jan. 19, 1861.
 Re-entered Union: July 15, 1870.
 Present constitution adopted: 1945.
 Motto: Wisdom, justice and moderation.
 State flower: Cherokee rose (1916).
 State tree: Live oak (1937).
 State bird: Brown thrasher (1935).
 State song: "Georgia" (1922).
 Nicknames: Peach State; Empire State of the South.
 Origin of name: In honor of George II of England.
 1940 population & (rank): 3,123,723 (14).
 1950 population & (rank): 3,444,578 (13).
 1956 estimated population: 3,712,000.
 Area & (rank): 58,876 sq. mi. (20).
 Geographic center: In Twiggs Co., 18 mi. SE of Macon.
 Number of counties: 159.
 Largest cities (1950 Census): Atlanta (331,314); Savannah (119,638); Columbus (79,611); Augusta (71,508); Macon (70,252).
 State forests: 2 (2,000 ac.).
 State parks: 25 (32,222 ac.).
 State general revenue (1951): \$228,876,399.59.
 State general allocations (1951): \$217,110,506.78.

Georgia is typical of the changing South. The value of its factory products has passed the value of its farm products, and industrialization is ever increasing. Atlanta is achieving importance as an industrial center. Cotton and lumber products, fertilizer, processed food and a great variety of other items are among the factory output of Macon, Augusta, Savannah and Columbus.

Georgia ranks high in cotton, tobacco, peanuts and pecans. Georgia's peaches are nationally famous. From its vast stands of pine come more than half of all U. S. resin and turpentine. The state is one of the leaders in the value of its clay products. Cattle grazing is extensive. Georgia marble is widely used.

Warm Springs has the celebrated foundation operated to aid infantile paralysis victims. It was there that President Franklin D. Roosevelt died on April 12, 1945.

Hernando de Soto, a Spaniard, in 1540, looked over the red clay of Georgia, and General James Oglethorpe founded its first British colony Feb. 12, 1733, at Savannah.

IDAHO

Capital: Boise.
 Governor: Robert E. Smylie, Rep. (to Jan. 1959).
 Organized as territory: Mar. 3, 1863.
 Entered Union & (rank): July 3, 1890 (43).
 Present constitution adopted: 1890.
 Motto: *Esto perpetua* (It is perpetuated).
 State flower: Syringa (1931).
 State tree: White pine (1935).
 State bird: Mountain bluebird (1931).
 State song: "Here We Have Idaho."
 Nicknames: Gem State; Gem of the mountains.
 Origin of name: From a Shoshoni Indian word meaning "sunup."
 1940 population & (rank): 524,873 (42).
 1950 population & (rank): 588,637 (43).
 1957 estimated population: 640,000.
 Area & (rank): 83,557 sq. mi. (12).
 Geographic center: In Custer Co., 24 mi. S of W of Challis.
 Number of counties: 44, plus small part of Yellowstone Park.
 Largest cities (1950 Census): Boise (34,393); Pocatello (26,131); Idaho Falls (19,218); Twin Falls (17,600); Nampa (16,185); Lewiston (12,985).
 State forests: 925,000 ac.
 State parks: 4 (9,000 ac.).
 State revenue (1952): general fund, \$21,928,219.92; special funds, \$67,634,499.06.
 State expenditure (1952): general fund, \$19,449,181.12; special funds, \$66,491,880.24.
 Idaho's huge investment in irrigation has advanced its agriculture well ahead of its mining. Idaho potatoes are eaten everywhere. The state grows apples and other fruits and wheat, corn and barley. There is light diversified manufacturing and Pocatello sells its cheese to a world market.
 Idaho mines gold, silver, lead, zinc, copper and tungsten, and still has vast undeveloped mineral wealth. In its rugged central mountains is an area that is reachable only by pack horse. The forests of the state, cover-

ing at least one-third of the area, account for the fact that lumbering is extensive.

Tourist trade is important. Hunting and fishing are excellent. Sun Valley is a famed resort and attracts countless tourists to its swimming and skiing facilities.

Lewis and Clark visited Idaho in 1805 but real settlement began with the gold strike of 1860.

ILLINOIS

Capital: Springfield.

Governor: William G. Stratton, Rep. (to Jan. 1960).

Organized as territory: Feb. 3, 1809.

Entered Union & (rank): Dec. 3, 1818 (21).

Present constitution adopted: 1870.

Motto: State sovereignty, national union.

State flower: Violet (1908).

State tree: Oak (1908).

State bird: Cardinal (1929).

State song: "Illinois" (1925).

State slogan: Land of Lincoln.

Nickname: Prairie State.

Origin of name: From an Indian word and French suffix meaning "tribe of superior men."

1940 population & (rank): 7,897,241 (3).

1950 population & (rank): 8,712,176 (4).

1956 estimated population: 9,432,000.

Area & (rank): 56,400 sq. mi. (23).

Geographic center: In Logan Co., 28 mi. NE of Springfield.

Number of counties: 102.

Largest cities (1950 Census): Chicago (3,620,962); Peoria (111,856); Rockford (92,927);

East St. Louis (82,295); Springfield (81,628).

State forests: 3 (10,278 ac.).

State parks, memorials, conservation areas: 73 (28,000 ac.).

State revenue (1956): \$806,650,642.

State expenditure (1956): \$721,623,759.

Illinois anchors the Midwest like a rich giant, versatile in every big wealth-making industry. It stands high in manufacturing, coal mining, farm cash income, oil production. The sprawling Chicago district (including a slice of Indiana) is a great iron and steel producer, meat packer, grain exchange and railroad center. Chicago is also a busy long-flight airport city and Great Lakes port area. The Illinois sand and gravel business is exceeded only by that of California.

In agriculture, Illinois is first in soy beans and high in corn, oats, wheat, barley, rye, potatoes and truck vegetables. Hog raising and dairying are important industries of the state.

Illinois manufactures almost everything. Railroad cars, clothing, furniture, tractors, liquor, watches and farm implements are some of the items made in its several cities. An important U. S. arsenal is located on a Mississippi island off Rock Island.

Central Illinois is noted for shrines and memorials associated with the life and works of Abraham Lincoln, greatest son of Illinois. In Springfield are the Lincoln Home and Lincoln Tomb. At New Salem State Park, 20 miles northwest of Springfield, the reconstructed village of New Salem stands as a notable Lincoln memorial.

Marquette and Joliet, in 1673, were the first known explorers of this state.

INDIANA

Capital: Indianapolis.

Governor: Harold W. Handley, Rep. (to Jan. 1961).

Organized as territory: May 7, 1800.

Entered Union & (rank): Dec. 11, 1816 (19).

Present constitution adopted: 1851.

Motto: The Crossroads of America.

State flower: Peony (1957).

State tree: Tulip tree (1931).

State bird: Cardinal (1933).

State song: "On the Banks of the Wabash, Far Away" (1913).

Nickname: Hoosier State.

Origin of name: Meaning "land of Indians."

1940 population & (rank): 3,427,796 (12).

1950 population & (rank): 3,934,224 (12).

1956 estimated population: 4,422,800.

Area & (rank): 36,291 sq. mi. (37).

Geographic center: In Boone Co., 14 mi. W of N of Indianapolis.

Number of counties: 92.

Largest cities (1950 Census): Indianapolis (427,173); Gary (133,911); Ft. Wayne (133,607);

Evansville (128,636); South Bend (115,911).

State forests: 14 (113,880.46 ac.).

State parks: 18 (47,386.43 ac.).

State general revenue (1955): \$389,419,000.*

State general expenditure (1955): \$441,118,000.†

* Includes borrowing. † Includes redemptions.

Indiana's fifty-one-mile Michigan waterfront is one of the great industrial centers of the world, turning out iron and steel and oil products to make this state a leader in manufacturing. Its cities have some of the world's largest industrial plants and their great output is further swelled by the inland factories. The list of products is endless—automobiles, farm implements, aviation and railroad equipment, sewing machines are made from iron ore mined in the Great Lakes region.

In farming the state stands high in soy beans, corn, tobacco, onions, wheat, oats, rye and tomatoes.

Indianapolis is the second largest U. S. city not on a navigable body of water. Wyandotte Cave, the second largest in the U. S., is located in Crawford County of Southern Indiana. West Baden and French Lick are well known for their mineral springs. Indiana was one of the early states to adopt the secret ballot based on the Australian system.

IOWA

Capital: Des Moines.

Governor: Herschel C. Loveless, Dem. (to Jan. 1959).

Organized as territory: June 12, 1838

Entered Union & (rank): Dec. 28, 1846 (29).

Present constitution adopted: 1857.

Motto: Our liberties we prize and our rights we will maintain.

State flower: Wild rose (1897).

State bird: Eastern goldfinch (1933).

State colors: Red, white and blue (in state flag).

State song: "Song of Iowa."

Nickname: Hawkeye State.

Origin of name: Probably from an Indian word meaning "I-o-w-a, this is the place."

1940 population & (rank): 2,538,268 (20).

1950 population & (rank): 2,621,073 (22).

1956 estimated population: 2,692,000.

Area & (rank): 56,280 sq. mi. (24).

Geographic center: In Marshall County, 2½ mi. S of State Center.

Number of counties: 99.

Largest cities (1950 Census): Des Moines (177,965); Sioux City (83,991); Davenport (74,549); Cedar Rapids (72,296); Waterloo (65,198).

State forests: 7 (13,469 ac.).

State parks: 89 (28,437 ac.).

State general revenue (1955-56): \$140,949,965.

State general expenditure (1955-56): \$136,917,930.

Iowa stands in a class by itself as an agricultural state, supplying 10% of the nation's food supply. It ranks first in livestock income, value of beef marketed, production averages of oats and popcorn, and production of hogs, chickens, eggs, corn and timothy seed. Nearly 95% of the state's total acreage is in farms, and the fertility of its soil is unsurpassed. Of all the Grade A land in the country, 25% is in Iowa.

However, the value of Iowa's manufactured products exceeds that of her agricultural products. The top industrial activity is meat packing. Des Moines fittingly leads all cities in the publication of farm journals and is also a large insurance center.

Iowa has the lowest functional illiteracy rate in the nation.

West Branch is the birthplace of Herbert Hoover, who was the first President of the U. S. to be born west of the Mississippi.

Marquette and Joliet first explored the state in 1673.

KANSAS

Capital: Topeka.

Governor: George Docking, Dem. (to Jan. 1959).

Organized as territory: May 30, 1854.

Entered Union & (rank): Jan. 29, 1861 (34).

Present constitution adopted: 1861.

Motto: *Ad astra per aspera* (To the stars through difficulties).

State flower: Sunflower (1903).

State tree: Cottonwood (1937).

State bird: Western meadow lark (1937).

State animal: Buffalo (1955).

State song: "Home on the Range" (1947).

State march: "The Kansas March" (1935).

Nicknames: Sunflower State; Jayhawk State.

Origin of name: From a Sioux word meaning "people of the south wind."

1940 population & (rank): 1,801,028 (29).

1950 population & (rank): 1,905,299 (31).

1956 estimated population: 2,077,711.

Area & (rank): 82,276 sq. mi. (13).

Geographic center: In Barton Co., 15 mi. NE of Great Bend.

Number of counties: 105.

Largest cities (1950 Census): Wichita (168,279);

Kansas City (129,553); Topeka (78,791);

Hutchinson (33,575); Salina (26,176).

State forests: 1 (4,000 ac.).

State parks: 22 (14,394 ac.).

State operating revenue (1955-56): \$253,293,446.
State operating expenditure (1955-56): \$245,641,297.

Kansas finds its strength in wheat growing, flour milling and a variety of manufacturing enterprises. Slaughtering and meat packing are also extensively pursued. In the western part of the state, where Dodge City recalls the old days of cattle rustling, rich prairie land sprawls over a large area and gives an abundance of winter wheat and fine grazing.

Corn, sorghums, oats, barley, soy beans and potatoes are other crops. Besides oil, Kansas mines zinc, coal, salt and lead.

The state is the geographical center of the U. S., and the geodetic center of the North American continent.

Wichita, a growing industrial center, is a leader in the production of military and civilian aircraft. Kansas City is a transportation, milling, and meat-packing center.

After being dry since the Murray Liquor Law of 1881, Kansas repealed prohibition in March 1949.

Points of unusual interest in Kansas include: President Eisenhower's boyhood home and the new Eisenhower Memorial Museum at Abilene; the geographic center of the U. S. at Lebanon; John Brown's well-preserved cabin at Osawatimie; and two historic military reservations—Ft. Leavenworth and Ft. Riley.

KENTUCKY

Capital: Frankfort.

Governor: A. B. Chandler, Dem. (to Dec. 1959).

Entered Union & (rank): June 1, 1792 (15).

Present constitution adopted: 1891.

Motto: United we stand, divided we fall.

State flower: Goldenrod.

State bird: Kentucky cardinal.

State song: "My Old Kentucky Home."

Nickname: Blue Grass State.

Origin of name: From an Iroquoian Indian word "Ken-tah-ten" meaning "land of tomorrow."

1940 population & (rank): 2,845,627 (16).

1950 population & (rank): 2,944,806 (19).

1956 estimated population: 3,017,000.

Area & (rank): 40,395 sq. mi. (36).

Geographic center: In Marion Co., 3 mi. W of N of Lebanon.

Number of counties: 120.

Largest cities (1950 Census): Louisville (369,129); Covington (64,452); Lexington (55,534); Owensboro (33,651); Paducah (32,828).

State forests: 3 (30,022 ac.).

State parks: 26 (16,888 ac.).

Total state revenue (1955-56): \$242,483,022.

Total state expenditure (1955-56): \$243,237,167.

Kentucky prides itself on producing some of the nation's best tobacco, horses and whisky. It stands high in the production of native asphalt, hemp, coal, corn, oil.

Among the manufactured items produced by its cities are furniture, aluminum ware, brooms, shoes, lumber products, machinery, textiles and iron and steel products. Besides coal and oil, important minerals are natural gas and quarry products.

Louisville, the largest city, famed for the Kentucky Derby at Churchill Downs, has a large municipal university, distills whiskey and is a great cigarette maker. The Blue Grass country is the home of some of the world's finest race horses. Lexington, standing in the center of this country, is a leading tobaccoist. Mammoth Cave, with its many miles of underground passages, is one tourist attraction. Another is Kentucky Lake, 184 miles wide, one of the largest man-made bodies of water in the world.

Kentucky was credited with a star in the Confederate flag because a secessionist group in the southwest part of the state set up a short-lived government and joined the Confederacy. The legitimate government, however, remained in the Union throughout the Civil War.

Marquette and Joliet in 1673 saw Kentucky when it was the "Dark and Bloody Ground," fiercely contested by Indian tribes. Daniel Boone explored the country in 1767.

LOUISIANA

Capital: Baton Rouge.

Governor: Earl K. Long, Dem. (to May 1960).

Organized as territory: Mar. 26, 1804.

Entered Union & (rank): Apr. 30, 1812 (18).

Seceded from Union: Jan. 26, 1861.

Re-entered Union: May 26, 1865.

Present constitution adopted: 1921.

Motto: Union, justice and confidence.

State flower: Magnolia (1900).

State bird: Pelican (unofficial).

State song: "Song of Louisiana."

Nicknames: Pelican State; Creole State; Sugar State.

Origin of name: In honor of Louis XIV of France.

1940 population & (rank): 2,363,880 (21).

1950 population & (rank): 2,683,516 (21).

1956 estimated population: 3,004,000.

Area & (rank): 48,523 sq. mi. (30).

Geographic center: In Avoyelles Parish, 3 mi. SE of Marksville.

Number of parishes (counties): 64.

Largest cities (1950 Census): New Orleans

(570,445); Shreveport (127,206); Baton

Rouge (125,629); Lake Charles (41,272);

Monroe (38,572).

State forests: 1 (8,000 ac.).

State parks: 15 (13,323 ac.).

State general revenue (1955-56): \$535,399,433.

State general expenditure (1955-56): \$496,325,624.

Louisiana, which still calls its counties parishes after the Spanish religious divisions, is one of the leading states in fur trapping, with a rich annual bag of mink, muskrat, opossum and raccoon pelts. Other important agricultural products are sugar cane, sweet potatoes, rice and cotton. The state is rapidly becoming industrialized, and is an important producer of petroleum and petrochemicals, pulp and paper, natural gas, sulfur, chemicals and salt.

New Orleans, home of the Mardi Gras, avoids flooding only by an expensive levee and spillway system. Her industry is making increased use of raw materials from South and Central America. The Vieux Carré, in this Old World city, called by many the

"Little Paris" of the New World, has some of the celebrated restaurants of the nation.

Louisiana has a great variety and abundance of game birds. Its state-owned wildlife sanctuaries are among the world's largest.

Hernando de Soto, in the year 1540, is usually considered the first white man to see the state, but claims are made for Narvaez, who is reputed to have seen the state as early as 1528.

MAINE

Capital: Augusta.

Governor: Edmund S. Muskie, Dem. (to Jan. 1959).

Entered Union & (rank): Mar. 15, 1820 (23).

Present constitution adopted: 1820.

Motto: *Dirigo* (I guide).

State flower: White pine cone and tassel (1895).

State tree: Pine tree.

State bird: Chickadee (1927).

State song: "State of Maine Song" (1937).

Nickname: Pine Tree State.

Origin of name: From the French province of Mayne.

1940 population & (rank): 847,226 (35).

1950 population & (rank): 913,774 (35).

1956 estimated population: 910,000.

Area & (rank): 33,215 sq. mi. (38).

Geographic center: In Piscataquis Co., 18 mi. N of Dover-Foxcroft.

Number of counties: 16.

Largest cities (1950 Census): Portland (77,634);

Lewiston (40,974); Bangor (31,558); Au-

burn (23,134); South Portland (21,866).

State forests: 1 (21,000 ac.).

State parks: 6 (133,042 ac.).

State general revenue (1956): \$95,922,020.

State general expenditure (1956): \$91,685,260.

Maine, the largest potato grower in the nation, is supposed to be the political barometer of the nation because it holds its general election a little more than a month before the other states, a situation that has brought forth the popular expression, "As Maine goes, so goes the nation." But considering that the state invariably votes Republican, it is evident that the nation sometimes fails to follow it.

Maine has the largest forest area in the East, some 16,783,000 acres in timberland and, as a result, pulp, paper making and lumbering are leading industries. In addition to the potato crops, hay, oats, buckwheat and apples are grown. Manufacturing includes textiles, shoes and fruit canning. Much poultry is raised.

Acadia National Park, on Mount Desert Island, approximately 50 miles southeast of Bangor, offers one of the finest examples of mountain and ocean views to be found on the Atlantic.

With 2,500 lakes, hundreds of streams and a bracing summer climate, Maine is famous as a resort state. Fishing is excellent and deer, bear and other game are plentiful. Its city of Eastport is the most easterly city in the U. S., and York was the first chartered city (in 1642) in the nation.

MARYLAND

Capital: Annapolis.
Governor: Theodore R. McKeldin, Rep. (to Jan. 1959).
Entered Union & (rank): Apr. 28, 1788 (7).
Present constitution adopted: 1867.
Motto: *Fatti maschii, parole femine* (Manly deeds, womanly words).
State flower: Black-eyed susan (1918).
State tree: White oak (1941).
State bird: Baltimore oriole (1882).
State colors: Black and gold (1904).
State song: "Maryland! My Maryland!" (1939).
Nicknames: Free State; Old Line State.
Origin of name: In honor of Henrietta Maria (Queen of Charles I of England).
1940 population & (rank): 1,821,244 (28).
1950 population & (rank): 2,343,001 (24).
1956 estimated population: 2,812,000.
Area & (rank): 10,577 sq. mi. (41).
Geographic center: In Anne Arundel Co., 3 mi. E of Collington.
Number of counties: 23, plus 1 independent city.
Largest cities (1950 Census): Baltimore (949,708); Cumberland (37,679); Hagerstown (36,260); Frederick (18,142); Salisbury (15,141), Annapolis (10,047).
State forests: 10 (119,795 ac.).
State parks: 13 (11,181.5 ac.).
State general revenue (1956): \$489,493,741.
State general expenditure (1956): \$474,597,974.

Maryland is cut almost in two by Chesapeake Bay, and the many estuaries and rivers create one of the longest water fronts of any state. The Bay produces more seafood—oysters, crabs, clams, fin fish—than any comparable body of water, and is a major crabbing center. Important agricultural products are vegetables, tobacco, corn, wheat, soy beans, and dairy products. Maryland is a leader in vegetable canning and broiler raising. Sand and gravel, stone, coal, and clay are the chief mineral products.

Manufactures, which center in Baltimore, include airplanes, steel, clothing, and chemicals. The port of Baltimore ranks second in the country in foreign trade tonnage. Baltimore is the home of the Johns Hopkins University and Hospital. In Annapolis, State capital and home of the U. S. Naval Academy, is one of the earliest state houses (1772-1779) still in regular use by a State government.

The Charter of Maryland was granted in 1632 to Lord Baltimore, who died before it had passed the Great Seal; it was issued to his oldest son, Cecil. The first settlers landed at St. Mary's in 1634.

MASSACHUSETTS

Capital: Boston.
Governor: Foster Furcolo, Dem. (to Jan. 1959).
Entered Union & (rank): Feb. 6, 1788 (6).
Present constitution adopted: 1780.
Motto: *Ense petit placidam sub libertate quietem* (By the sword we seek peace, but peace only under liberty).
State flower: Mayflower (1918).
State tree: American elm (1941).
State bird: Chickadee (1941).
State colors: Blue and gold (in flag and shield).

State song: None.

Nicknames: Bay State; Old Colony State.

Origin of name: From two Indian words meaning "great mountain place."

1940 population & (rank): 4,316,721 (8).

1950 population & (rank): 4,690,514 (9).

1955 population: 4,837,645.

Area & (rank): 8,257 sq. mi. (44).

Geographic center: In Worcester Co., in N part of city of Worcester.

Number of counties: 14.

Largest cities (1955 State Census): Boston (724,702); Worcester (202,612); Springfield (166,052); New Bedford (105,488); Fall River (105,195).

State forests: 70 (170,000 ac.).

State parks: 7 (4,792 ac.).

State general revenue (1954): \$447,076,000.

State general expenditure (1954): \$523,495,000.

Massachusetts is the leading shoe producer in the U. S., and has been one of the leaders in the making of textiles since the beginning of American history. The top-ranking industries are electrical and other machinery, leather and leather products, apparel and fabricated metals. Logan International Airport at East Boston, the nearest point in the U. S. to Europe, ranks among the world's greatest aerodromes. It has the longest commercial runway in the U. S. (10,022 ft.) and the longest air passenger terminal building in the world (3,053 ft.).

The most valuable agricultural products, ranked in order of importance, are hay, tobacco, cranberries, apples, potatoes, corn and tomatoes. There is also a large livestock industry, especially poultry.

The growth of factories brought to this state an influx of foreigners and today Boston has one of the largest Irish populations in the nation. Boston became prominent as the "Cradle of Liberty" in early days and it was here that Paul Revere rode from Christ Church on Copp's Hill and the Battle of Bunker Hill was fought.

Small glacial lakes are scattered throughout the state.

The Pilgrims landed at Plymouth Rock in 1620 as the first large group to settle here but legend has it that Eric the Red and his Norsemen saw the state in the year 1000.

MICHIGAN

Capital: Lansing.

Governor: G. Mennen Williams, Dem. (to Jan. 1959).

Organized as territory: Jan. 11, 1805.

Entered Union & (rank): Jan. 26, 1837 (26).

Present constitution adopted: 1908.

Motto: *Si quaeris peninsulam amoenam circumspice* (If you seek a pleasant peninsula, look around you).

State flower: Apple blossom (1897).

State bird: Robin (unofficial).

State animal: Wolverine (unofficial).

State song: "Michigan, My Michigan" (unofficial).

Nickname: Wolverine State.

Origin of name: From two Indian words meaning "great lake."

1940 population & (rank): 5,256,106 (7).

1950 population & (rank): 6,371,766 (7).

1956 estimated population: 7,516,000.

Area & (rank): 58,216 sq. mi. (22).

Geographic center: In Wexford Co., 5 mi. W of N of Cadillac.

Number of counties: 83.

Largest cities (1950 Census): Detroit (1,849,568); Grand Rapids (176,515); Flint (163,143); Dearborn (94,994); Saginaw (92,918).

State forests: 23 (3,744,082 ac.).

State parks: 60 (178,991 ac.).

State general revenue (1954-55): \$787,522,861.

State general expenditure (1954-55): \$757,845,501.

On a map of Michigan, draw an eighty-five-mile circle around Detroit and it will contain the home plants of the companies that make nine out of ten American automobiles. This industry, which sprang up about fifty years ago from the carriage-building business, is not the only activity of this state. Airplane parts, furniture (Grand Rapids is the furniture center of the U. S.), diesel engines, hoists, pumps, boilers are among its leading items of production. Most of the nation's refrigerators are made in Michigan. On its farms are grown dry beans, grapes, peaches, potatoes, sugar beets and other food crops.

Michigan is the only state that is split completely in two parts. The northern peninsula is mining and timber country. The southern part is agricultural and manufacturing country. Connecting Lakes Superior and Huron is the busiest canal in the world—the Sault Ste. Marie. Its 11,037 inland lakes and 2,242 miles of Great Lakes shoreline make Michigan a good vacation land.

Michigan has the greatest inland fisheries in the world and markets at least 20 species from carp, trout, perch, pike to lake herring. The artificial ski jump on Iron Mountain is probably the highest in the world.

Jacques Cartier, in 1535, was the first white man to see the state.

MINNESOTA

Capital: St. Paul.

Governor: Orville L. Freeman, Dem. (to Jan. 1959).

Organized as territory: Mar. 3, 1849.

Entered Union & (rank): May 11, 1858 (32).

Present constitution adopted: 1858.

Motto: *L'Etoile du Nord* (The North Star).

State flower: Moccasin flower (1902).

State tree: Norway pine.

State bird: None.

State song: "Hail Minnesota."

Nicknames: North Star State; Gopher State;

Land of 10,000 Lakes.

Origin of name: From a Dakota Indian word meaning "sky-tinted water."

1940 population & (rank): 2,792,300 (18).

1950 population & (rank): 2,982,483 (18).

1956 estimated population: 3,248,196.

Area & (rank): 84,068 sq. mi. (11).

Geographic center: In Crow Wing Co., 10 mi. SW of Brainerd.

Number of counties: 87.

Largest cities (1950 Census): Minneapolis (521,718); St. Paul (311,349); Duluth (104,511); Rochester (29,885); St. Cloud (28,410).

State forests: 32 (2,037,065 ac.).

State parks: 61 (84,350 ac.).

State general revenue (1956): \$589,547,807.

State general expenditure (1956): \$579,466,244.

A few square miles of Northern Minnesota, in the Mesabi, Cuyuna and Vermillion Ranges, produce most of the nation's iron ore, and provide the activity for the port of Duluth. Farm and factory are equally important in Minnesota. Its farms produce oats, butter, eggs, milk, corn, wheat, potatoes, etc. Its factory production follows the pattern of the Midwest. Machinery, furniture, foundry products, etc. are manufactured.

Minneapolis is the trade center of the Northwest. Its twin city St. Paul is the nation's biggest publisher of calendars and law books.

With over 11,000 lakes, the state is famous for its fishing, hunting and trapping.

Minnesota has many famous resort regions. Travel business for 1954 was estimated to exceed \$290 million.

In 1655, Radisson and Groselliers, French traders from Canada, were the first white men to see the state.

MISSISSIPPI

Capital: Jackson.

Governor: J. P. Coleman, Dem. (to Jan. 1960).

Organized as territory: Apr. 7, 1798.

Entered Union & (rank): Dec. 10, 1817 (20).

Seceded from Union: Jan. 9, 1861.

Re-entered Union: Feb. 23, 1870.

Present constitution adopted: 1890.

Motto: *Virtute et armis* (By valor and arms).

State flower: Flower or bloom of the magnolia or evergreen magnolia (1952).

State tree: Magnolia (1938).

State bird: Mockingbird (1944).

State song: "Way Down South in Mississippi" (1948).

Nickname: Magnolia State.

Origin of name: From an Indian word meaning "Father of Waters."

1940 population & (rank): 2,183,796 (23).

1950 population & (rank): 2,178,914 (26).

1956 estimated population: 2,124,000.

Area & (rank): 47,716 sq. mi. (31).

Geographic center: In Leake Co., 9 mi. N of W of Carthage.

Number of counties: 82.

Largest cities (1950 Census): Jackson (98,271);

Meridian (41,893); Biloxi (37,425); Greenville (29,936); Hattiesburg (29,474).

State forests: 1 (1,760 ac.).

State parks: 10 (10,972 ac.).

State general revenue (1950): \$132,573,383.20.

State general expenditure (1950): \$134,463,877.57.

Mississippi, the stronghold of the Old South, has until the past decade been one of the least industrialized states, with more than half its population making a living from the soil. A recent program of industrialization, however, has attracted numerous manufacturing concerns. Cotton, nevertheless, is still king. The world's largest

cotton plantation of 35,000 acres is located at Scott. Other crops are corn, peanuts, oats, pecans, soybeans, rice, tung nuts, sugar cane and hay.

Mississippi's Central Hills have produced a serious soil-erosion problem due to the over-emphasis placed on cotton growing through the years. Introduction of livestock and dairying and the pasture improvement programs attendant to it have helped in recent years to remedy this situation.

Mississippi was first to ratify the 18th Amendment and is still one of the two states (the other, Oklahoma) that bans the sale of hard liquor. In 1950, it had the third largest Negro population in the U. S.

The state abounds in historical landmarks and is the home of the Vicksburg National Military Park commemorating Grant's victory on this site.

MISSOURI

Capital: Jefferson City.

Governor: James T. Blair, Jr., Dem. (to Jan. 1961).

Organized as territory: June 4, 1812.

Entered Union & (rank): Aug. 10, 1821 (24).

Present constitution adopted: 1945.

Motto: *Salus populi suprema lex esto* (The welfare of the people shall be the supreme law).

State flower: Hawthorn (1923).

State bird: Bluebird (1927).

State colors: Red, white and blue (1913).

State song: "Missouri Waltz" (1949).

State tree: Dogwood (1955).

Nickname: Show-me State.

Origin of name: From an Indian word probably meaning "muddy water."

1940 population & (rank): 3,784,664 (10).

1950 population & (rank): 3,954,653 (11).

1956 estimated population: 4,255,000.

Area & (rank): 69,226 sq. mi. (18).

Geographic center: In Miller Co., 20 mi. SW of Jefferson City.

Number of counties: 114, plus 1 independent city.

Largest cities (1950 Census): St. Louis (856,796); Kansas City (456,622); St. Joseph (78,588); Springfield (66,731); University City (39,892).

State forests: 8 (163,000 ac.).

State parks: 30 (70,000 ac.).

State general revenue (1955-56): \$388,381,232.

State general expenditure (1955-56): \$385,686,411.

Missouri, touching both South and North, ranks highest in mining lead, making corn-cob pipes and breeding mules. Sometimes called the "saddle horse capital of the world" because of its excellent breeds, this state also grows corn, wheat, oats, barley, potatoes, tobacco and cotton on its fertile table land climbing to the Ozark Mountains. This country of rugged, timbered hills and deep valleys, has more than 10,000 swift-flowing streams. It produces automobiles, shoes, drugs, chemicals, beer and street cars.

Eads Bridge, spanning the Mississippi River at St. Louis, probably handles more freight cars than any other bridge in the world. Bagnell Dam, across the Osage River in the Ozarks, completed in 1931, created

one of the largest artificial lakes in the world, running for 129 miles and having a shoreline that extends for approximately 1,300 miles.

The homes of two of Missouri's most publicized sons—Mark Twain and Jesse James—are tourist attractions.

Missouri, like Kentucky, had a star in the Confederate flag because a minority of the state legislature adopted an ordinance of secession. The Governor and pro-secession legislature, however, were ousted and the state remained in the Union.

MONTANA

Capital: Helena.

Governor: J. Hugo Aronson, Rep. (to Jan. 1961).

Organized as territory: May 26, 1864.

Entered Union & (rank): Nov. 8, 1889 (41).

Present constitution adopted: 1889.

Motto: *Oro y plata* (Gold and silver).

State flower: Bitterroot (1895).

State tree: Ponderosa pine (1949).

State bird: Western meadow lark (1931).

State song: "Montana" (1945).

Nickname: Treasure State.

Origin of name: Chosen from Mexican dictionary by J. M. Ashley. It is a Mexicanized Spanish word.

1940 population & (rank): 559,456 (39).

1950 population & (rank): 591,024 (42).

1956 estimated population: 675,000.

Area & (rank): 147,138 (3).

Geographic center: In Fergus Co., 12 mi. W of Lewistown.

Number of counties: 56, plus small part of Yellowstone National Park.

Largest cities (1950 Census): Great Falls (39,214); Butte (33,251); Billings (31,834); Missoula (22,485); Helena (17,581).

State forests: 7 (686,000 ac.).

State parks: 14 (2,802 ac.).

State general revenue (1955-56): \$106,322,876.

State general expenditure (1955-56): \$100,040,570.

Montana's story is the old Western story—few settlers until a gold strike in 1858 brought an influx. Mining is its present occupation, and lead, zinc, silver, coal and oil are taken from its earth.

Butte, sitting on the "richest hill in the world," is the center of the area that once supplied half of the U. S. copper (its most important mineral). Livestock, wool, lumber and dude ranching round out its interests. Agriculture in the state is dependent on irrigation.

The state as a whole still possesses the frank character of the old days, reflected in the legend that the only reason Helena was selected as the name to replace Last Chance Gulch was because of the suggestion of profanity in the front part of that name. Glacier National Park is a popular tourist area with its rugged scenery, hunting areas and dude ranches. While little development has as yet been made, Montana offers fine potentialities for winter sports. Snow conditions are good throughout the winter in the National Forest Service areas.

NEBRASKA

Capital: Lincoln.

Governor: Victor E. Anderson, Rep. (to Jan. 1959).

Organized as territory: May 30, 1854.

Entered Union & (rank): Mar. 1, 1867 (37).

Present constitution adopted: 1875.

Motto: Equality before the law.

State flower: Goldenrod (1895).

State tree: American elm (1937).

State bird: Western meadow lark (1929).

State song: "My Nebraska" (unofficial).

Nickname: Cornhusker State.

Origin of name: From an Oto Indian word meaning "flat water."

1940 population & (rank): 1,315,834 (32).

1950 population & (rank): 1,325,510 (33).

1956 estimated population: 1,414,000.

Area & (rank): 77,407 sq. mi. (14).

Geographic center: In Custer Co., 10 mi. NW of Broken Bow.

Number of counties: 93.

Largest cities (1950 Census): Omaha (251,117);

Lincoln (98,884); Grand Island (22,682);

Hastings (20,211); North Platte (15,433).

State forests: 2.

State parks: 7 (1,036 ac.).

State general revenue (1956): \$112,093,658.

State general expenditure (1956): \$112,093,658.

Nebraska lives by its expansive sea of grain, reflected in its bumper crops of rye, corn and wheat. There are more varieties of grass growing in this state, valuable for forage, than in any other state in the nation. Its sizable cattle and hog industry help to make Omaha a great stockyard and meat-packing center. Flour, freight cars, farm machinery, precision instruments, brick and tile are products of Nebraska.

Oil was discovered in Nebraska in 1939, and natural gas in 1949. The state was 14th in oil production in the U. S. for 1956.

In 1937, Nebraska became the only state in the Union to have a unicameral (one-house) legislature. Members are elected to it without party designation.

NEVADA

Capital: Carson City.

Governor: Charles H. Russell, Rep. (to Jan. 1959).

Organized as territory: Mar. 2, 1861.

Entered Union & (rank): Oct. 31, 1864 (36).

Present constitution adopted: 1864.

Motto: All for our country.

State flower: Sagebrush (1917).

State tree: Pinyon pine (official).

State bird: Mountain bluebird (unofficial).

State colors: Blue and silver (unofficial).

State song: "Home Means Nevada" (1933).

Nicknames: Sagebrush State; Silver State; Battle Born State.

Origin of name: Spanish: meaning "snow-clad."

1940 population & (rank): 110,247 (48).

1950 population & (rank): 160,083 (48).

1956 estimated population: 247,000.

Area & rank: 110,690 (6).

Geographic center: In Lander Co., 23 mi. SE of Austin.

Number of counties: 17.

Largest cities (1950 Census): Reno (32,497); Las Vegas (24,624); Sparks (8,203); Elko (5,393); North Las Vegas (3,875).

State forests: None.

State parks: 9 (11,337 ac.).

State general revenue (1956): \$65,539,225

State general expenditure (1956): \$58,139,456

Nevada, the smallest state in population, had in 1950 about one and one-half persons per square mile. It was made famous by the discovery of the fabulous Comstock Lode in 1859, and has since lived mainly on its mines which give up large quantities of gold, silver, copper, lead, zinc, quicksilver and tungsten. Oil was discovered for the first time in Feb. 1954. There are also uranium deposits.

In 1931, the state created a new industry by writing an easy divorce law and Reno has since become the "divorce capital of the nation." Gambling was legalized and the gaming tables now pay a tax to add to the state's income.

Near Las Vegas, on the Colorado River, stands the Hoover Dam which has twice changed its name (Hoover to Boulder to Hoover).

The state's agricultural crop consists mainly of hay, wheat, barley and potatoes.

Nevada was the first state to use gas for capital punishment.

NEW HAMPSHIRE

Capital: Concord.

Governor: Lane Dwinell, Rep. (to Jan. 1959).

Entered Union & (rank): June 21, 1788 (9).

Present constitution adopted: 1784.

Motto: Live free or die.

State flower: Purple lilac (1919).

State tree: White birch (1947).

State bird: None.

State song: "Old New Hampshire" (1949).

Nickname: Granite State.

Origin of name: From the English county of Hampshire.

1940 population & (rank): 491,524 (45).

1950 population & (rank): 533,242 (44).

1956 estimated population: 560,000.

Area & (rank): 9,304 sq. mi. (43).

Geographic center: In Belknap Co., 3 mi. E of Ashland.

Number of counties: 10.

Largest cities (1950 Census): Manchester (82,-

732); Nashua (34,669); Concord (27,988);

Portsmouth (18,830); Berlin (16,615).

State forests: 143 (55,769 ac.).

State parks: 33 (30,976 ac.).

State general revenue (1955): \$46,964,078.

State general expenditure (1955): \$58,774,503.

New Hampshire is the only state that ever played host at the formal conclusion of a foreign war when, in 1905, Portsmouth was the scene of the treaty ending the Russo-Japanese War. The sandy and stony loam of this state needs liberal fertilization for the growing of its principal crops—fruit, truck vegetables, corn, oats, hay and potatoes. Its chief manufacturing is the production of textiles, leather goods, pulp and paper products.

New Hampshire was the first state to declare its independence from Great Britain

and to adopt a constitution. Mt. Washington has recorded some of the world's strongest wind velocities, the last recording of record proportions being registered at 231 miles per hour. The state also has the largest legislative body; it varies from 375 to 400.

With 1,300 lakes and good climate for both winter sports and summer vacations, the state is highly popular as a resort area.

NEW JERSEY

Capital: Trenton.

Governor: Robert B. Meyner, Dem. (to Jan. 1958).

Entered Union & (rank): Dec. 18, 1787 (3).

Present constitution adopted: 1947.

Motto: Liberty and prosperity.

State flower: Purple violet (1913).

State bird: Eastern goldfinch (1935).

State tree: Red oak (1950).

State colors: Blue and gold.

State song: None.

Nickname: Garden State.

Origin of name: From the Channel Isle of Jersey.

1940 population & (rank): 4,160,165 (9).

1950 population & (rank): 4,835,329 (8).

1956 estimated population: 5,403,000.

Area & (rank): 8,204 sq. mi. (45).

Geographic center: In Mercer Co., 5 mi. SE of the State capitol.

Number of counties: 21.

Largest cities (1950 Census): Newark (438,776);

Jersey City (299,017); Paterson (139,336);

Trenton (128,009); Camden (124,555).

State forests: 11 (151,922 ac.).

State parks: 23 (26,825 ac.).

State general revenue (1955-56): \$448,412,087.

State general expenditure (1955-56): \$484,765,643.

New Jersey, situated in an area of wide industrial diversification between the major markets of Philadelphia and New York, is known as the crossroads of the East. Products from over 15,000 factories and shops can be delivered overnight to about 52 million people, representing 12 states and the District of Columbia. The greatest single industry is chemicals, and New Jersey is one of the foremost research centers of the world. Oil refining and shipbuilding are represented at Linden and Camden by some of the largest installations of their kind.

Of the total land area, 43% is forested and nearly 35% is devoted to agriculture. The state rates high in practically all garden vegetables. Among its fruit crops are the famous cultivated blueberries, which originated in New Jersey. The poultry industry is one of the principal phases of the state's agriculture, and dairying occupies a prominent place.

The oldest U. S. highway of any length was built in Sussex County. The New Jersey Turnpike links New York, Pennsylvania and Delaware. Its new span at Florence over the Delaware River connects with the Pennsylvania Turnpike, giving motorists an uninterrupted road from New York to Chicago. Garden State Parkway (toll) is now open from Cape May to the N. Y. Thruway (173 mi.).

Its fortunate topography and geographic location make New Jersey a popular resort state with over 100 resort areas.

NEW MEXICO

Capital: Santa Fe.

Governor: Edwin L. Mechem, Rep. (to Jan. 1959).

Organized as territory: Sept. 9, 1850.

Entered Union & (rank): Jan. 6, 1912 (47).

Present constitution adopted: 1912.

Motto: *Crescit eundo* (It grows as it goes).

State flower: Yucca (1927).

State tree: Piñon (1949).

State bird: Road runner (1949).

State fish: Cutthroat trout (1955).

State colors: Flaming red and golden orange (1915).

State song: "O, Fair New Mexico" (1916).

Nicknames: Land of Enchantment; Sunshine State.

Origin of name: From the country of Mexico.

1940 population & (rank): 531,818 (42).

1950 population & (rank): 681,187 (39).

1956 estimated population: 838,600.

Area & (rank): 121,666 sq. mi. (4).

Geographic center: In Torrance Co., 12 mi. W of S of Willard.

Number of counties: 32.

Largest cities (1950 Census): Albuquerque (96,815); Santa Fe (27,998); Roswell (25,738); Carlsbad (17,975); Clovis (17,318).

State forests: None.

State parks: 6 (16,018 ac.).

State general revenue (1956): \$160,588,000.

State general expenditure (1956): \$144,736,000.

New Mexico's chief industries are mining and the raising of cattle and crops. Irrigation is vital.

The state contains the largest Indian reservation in the U. S. with over 16,000,000 acres, inhabited by the Navajo tribe. The Apaches and Utes live in three other reservations in this state (the Jicarilla Apache, at Horse Lake; the Mescalero Apache, north-east of Alamogordo; the Navajo, in San Juan and McKinley counties; and the Southern Ute, in the northern part of San Juan County). Carlsbad Caverns, the largest in the world, attract many visitors annually. The highest golf course in the world, over 9,000 feet above sea level, is near Alamogordo.

The state's dry and healthful climate makes it a great recuperative mecca for tuberculars. Santa Fe, the oldest seat of government in the U. S., was founded by the Spaniards in 1609-10.

Los Alamos is the site of an atomic-energy laboratory. The first atomic explosion in history was at the Alamogordo air base.

NEW YORK

Capital: Albany.

Governor: W. Averell Harriman, Dem. (to Jan. 1959).

Entered Union & (rank): July 26, 1788 (11).

Present constitution adopted: 1777 (last revised 1938).

Motto: *Excelsior* (Ever Upward).

State flower: Rose (1955).

State tree: Sugar maple (1956).
 State bird: Unofficial.
 State song: None.
 Nickname: Empire State.
 Origin of name: In honor of the English Duke of York.
 1940 population & (rank): 13,479,142 (1).
 1950 population & (rank): 14,830,192 (1).
 1956 estimated population: 16,195,000.
 Area & (rank): 49,576 sq. mi. (29).
 Geographic center: In Madison Co., 6 mi. E of S of Oneida.
 Number of counties: 62.
 Largest cities (1950 Census): New York (7,891,957); Buffalo (580,132); Rochester (332,488); Syracuse (220,583); Yonkers (152,798).
 State Forest Preserves: Adirondacks, 2,233,802 ac.; Catskills, 234,611 ac.
 State parks: 82 (199,500 ac.).
 State general income (1956): \$1,368,600,000.
 State general outgo (1956): \$1,314,600,000.

New York, with the great metropolis of New York City, is the spectacular nerve center of the nation. It leads in population, manufacturing, foreign trade, commercial and financial transactions, book and magazine publishing, theatrical production, etc.

New York City is not only a national but an international leader. It is the busiest seaport in the world; New York International Airport is the largest in the world. First in manufacturing since 1824, the city today has a gigantic clothing and fur industry and also makes chemicals, paints, drugs, machinery, paper, wood and textile products and houses the tallest buildings in the world. Nearly all the rest of the state's manufacturing is done along the Hudson River north to Albany and through the Mohawk Valley and Central New York to Buffalo. It includes planes, heavy and light electrical equipment, locomotives, radio and TV sets, auto bodies and parts, washing machines, typewriters, photographic and optical equipment, shirts and flour. Dairying, truck gardening, and the raising of potatoes, onions and cabbage keep the New York farmer prosperous. Wine-making is a major industry in the state.

New York's extremely rapid commercial growth may be partly attributed to Governor De Witt Clinton who pushed through the construction of the Erie Canal (Buffalo to Albany) which was opened in 1825. Today, the 427 mile N. Y. Thruway connects New York City and Buffalo.

The convention and tourist business is the state's fifth greatest source of income.

For a short time, New York City was the U. S. Capital and George Washington was inaugurated there as the first President on April 30, 1789.

Henry Hudson explored New York in 1609 in his trip up the river later named in his honor. On the basis of his explorations, the Dutch bought the island of Manhattan for \$24 from the Indians in 1626.

11 NORTH CAROLINA

Capital: Raleigh.
 Governor: Luther H. Hodges, Dem. (to Jan. 1961).
 Entered Union & (rank): Nov. 21, 1789 (12).

Seceded from Union: May 20, 1861.
 Re-entered Union: July 20, 1868.
 Present constitution adopted: 1876.
 Motto: *Esse quam videri* (To be rather than to seem) (1893).

State flower: Dogwood (1941).
 State bird: Cardinal (1943).
 State song: "The Old North State" (1927).
 State colors: red and blue (1945).
 Nickname: Tar Heel State.
 Origin of name: In honor of Charles I of England.

1940 population & (rank): 3,571,623 (11).
 1950 population & (rank): 4,061,929 (10).
 1956 estimated population: 4,423,000.
 Area & (rank): 52,712 sq. mi. (27).
 Geographic center: In Chatham Co., 10 mi. NW of Sanford.

Number of counties: 100.
 Largest cities (1950 Census): Charlotte (134,042); Winston-Salem (87,811); Greensboro (74,389); Durham (71,311); Raleigh (65,679).
 State forests: 1.
 State parks: 11 (35,768 ac.).
 State revenue (all funds) (1955-56): \$366,058,333.

State expenditure (all funds) (1955-56): \$337,829,737.

North Carolina is the nation's largest tobacco and textile producer. It holds first place in the Southeast in population and in the value of its industrial and agricultural production. This production is highly diversified, with furniture, chemicals and paper constituting enormous industries. Tobacco, corn, cotton, hay, peanuts and truck and vegetable crops are of major importance.

The state leads the South in social and economic reforms. Its educational pay scale is the same for white and Negro teachers.

There are 19 state and national parks and forests, including the Great Smoky Mountains National Park, the Blue Ridge Parkway and the new Cape Hatteras National Seashore. Mt. Mitchell, on the Parkway near Asheville, is the highest mountain in the Eastern U. S. (6,684 ft. above sea level).

The largest military reservation in the U. S. (Fort Bragg) and the largest Marine amphibious training base (Camp Lejeune) are in North Carolina.

The first English colony in America was established on Roanoke Island in 1585. Virginia Dare, born there in 1587, was the first child of English parentage born in America.

NORTH DAKOTA

Capital: Bismarck.
 Governor: John E. Davis, Rep. (to Jan. 1959).
 Organized as territory: Mar. 2, 1861.
 Entered Union & (rank): Nov. 2, 1889 (39).
 Present constitution adopted: 1889.

Motto: Liberty and union, now and forever: one and inseparable.
 State flower: Wild prairie rose (1907).
 State tree: American elm (1947).
 State bird: Western meadow lark (1947).
 State song: "North Dakota Hymn" (1947).
 Nickname: Sioux State; Flickertail State.
 Origin of name: From the Dakotah tribe, meaning "allies."
 1940 population & (rank): 641,935 (39).

1950 population & (rank): 619,636 (41).

1956 estimated population: 657,000.

Area & (rank): 70,665 sq. mi. (16).

Geographic center: In Sheridan Co., 5 mi. SW of McClusky.

Number of counties: 53.

Largest cities (1950 Census): Fargo (38,256);

Grand Forks (26,836); Minot (22,032); Bismarck (18,640); Jamestown (10,697).

State forests: None.

State parks: 5 (2,981 ac.).

State collections (1955): \$60,162,232.

State disbursements (1955): \$60,108,524.

North Dakota, politically progressive, operates the only state-owned bank, flour mill and grain elevator in the nation. The state owes its main activity to agriculture with over 87 per cent of its acreage devoted to the growth of barley, wheat, rye, oats and livestock. Most of its manufacturing consists of dairy products.

The finest farming land is in the Red River Valley, celebrated in song. Cattle raising is centered in the Missouri Valley.

"Number One Northern Hard," a wheat first grown in this state, still brings premium prices for its excellence of quality.

The completion of Garrison Dam on the Missouri River will result in extensive irrigation and the production of 400,000 kw. of electricity for use in the Missouri Basin areas.

In 1951, oil was discovered near Tioga by the Amerada Petroleum Corp. Geologists believe that the state holds two-thirds of our lignite.

The geographic center of the North American continent is located in Pierce County, latitude 48°10'N, longitude 100°10'W.

OHIO

Capital: Columbus.

Governor: C. William O'Neill, Rep. (to Jan. 1959).

Entered Union & (rank): Mar. 1, 1803 (17).

Present constitution adopted: 1851.

Motto: *Imperium in imperio* (An empire within an empire) (unofficial).

State flower: Scarlet carnation (1904).

State bird: Cardinal (1933).

State song: None.

Nickname: Buckeye State.

Origin of name: From an Iroquoian word meaning "great river."

1940 population & (rank): 6,907,612 (4).

1950 population & (rank): 7,946,627 (5).

1957 estimated population: 9,050,000.

Area & (rank): 41,222 sq. mi. (34).

Geographic center: In Delaware Co., 25 mi. N of Columbus.

Number of counties: 88.

Largest cities (1950 Census): Cleveland (914,808); Cincinnati (503,998); Columbus (375,901); Toledo (303,616); Akron (274,605).

State forests: 20 (145,281 ac.).

State parks: 55 (22,074 ac.).

State general revenue (1956): \$1,204,317,462.

State general expenditure (1956): \$996,174,329.

With vast coal and oil fields on the one hand, with Great Lakes iron ore close by on the other, Ohio automatically developed

into one of the nation's greatest industrial states. The vast and varied factory output of its cities runs from wire, nails, nuts, bolts, paper, radios, cash registers, golf clubs, refrigerators to motors of all kinds and sizes. Cleveland is one of the world's largest handlers of iron ore. Toledo is the nation's largest shipper of coal. Akron makes most of the automobile tires used in the U. S.

Ohio's thousands of factories almost overshadow its importance in two other basic industries—mining and agriculture. Its fertile soil produces soy beans, corn, wheat, grapes and tobacco. Dairying and greenhouse products are important. Mining is centered in coal, oil, sand, gravel and clay.

Ohio has sent to the White House eight men, six of whom were elected from that state and two of whom were born in Ohio but elected from other states.

In 1749, Céleron, a French officer, reached the Ohio River from Canada and claimed the area for the French, disregarding the grants of the British Kings.

OKLAHOMA

Capital: Oklahoma City.

Governor: Raymond D. Gary, Dem. (to Jan. 1959).

Organized as territory: May 2, 1890.

Entered Union & (rank): Nov. 16, 1907 (46).

Present constitution adopted: 1907.

Motto: *Labor omnia vincit* (Labor conquers all things).

State flower: Mistletoe (1893).

State tree: Redbud (1937).

State bird: Scissor-tailed Flycatcher (1951).

State colors: Green and white (1915).

State song: "Oklahoma" (1953).

Nickname: Sooner State.

Origin of name: From two Choctaw Indian words meaning "red people."

1940 population & (rank): 2,336,434 (22).

1950 population & (rank): 2,233,351 (25).

1956 estimated population: 2,237,000.

Area & (rank): 69,919 sq. mi. (17).

Geographic center: In Oklahoma Co., 8 mi. N of Oklahoma City.

Number of counties: 77.

Largest cities (1950 Census): Oklahoma City (243,504); Tulsa (182,740); Muskogee (37,289); Enid (36,017); Lawton (34,757).

State forests: None.

State parks: 14 (52,086 ac.).

State general revenue (1956): \$325,017,839.*

State general expenditure (1956): \$340,728,806.

* Not including \$22,415,928 "non-revenue receipts."

Oil has made Oklahoma a rich state and Tulsa one of the world's wealthiest cities per capita. The smelting of zinc, oil refining, meat packing and flour milling are its chief factory industries. Wheat, corn, oats, cotton, sorghums and potatoes are its agricultural crops of chief importance.

In 1834, Oklahoma was set aside as Indian Territory. It remained so until Apr. 22, 1889, when the first opening to homestead settlement occurred. On that one day, 50,000 people swarmed in, and the term "sooners" was born to apply to those who had sneaked into the state sooner than the noon deadline. A series of land openings by "runs" and lot-

teries extended through 1901, and sales by sealed bid of remaining lands were held in 1906 and 1910.

The state is one of the two in the nation (the other is Mississippi) which prohibits the sale of hard liquor.

OREGON

Capital: Salem.

Governor: Robert D. Holmes, Dem. (to Jan. 1959).

Organized as territory: Aug. 14, 1848.

Entered Union & (rank): Feb. 14, 1859 (33).

Present constitution adopted: 1859.

Motto: The Union (1957).

State flower: Oregon grape (1899).

State tree: Douglas fir (1939).

State bird: Western meadow lark (1927).

State song: "Oregon, My Oregon" (1927).

Nickname: Beaver State.

Origin of name: Unknown. However, it is generally accepted that the name, first used by Jonathan Carver in 1778, was taken from the writings of Maj. Robert Rogers, an English army officer.

1940 population & (rank): 1,089,684 (34).

1950 population & (rank): 1,521,341 (32).

1956 estimated population: 1,734,650.

Area & (rank): 96,981 sq. mi. (9).

Geographic center: In Crook Co., 25 mi. E of S of Prineville.

Number of counties: 36.

Largest cities (1950 Census): Portland (373,628); Salem (43,140); Eugene (35,879); Medford (17,305); Corvallis (16,207).

State forests: 719,405 ac. in 14 counties.

State parks: 163 (57,487 ac.).

State general revenue (1956): \$231,343,000.

State general expenditure (1956): \$234,079,000.

Oregon, with the greatest U. S. reserve of standing timber, has a billion-dollar forestry industry. Its salmon fishing industry, centered at Astoria at the mouth of the Columbia River, is one of the world's largest.

In agriculture, the state leads in growing peppermint, holly, lily bulbs, caneberries, filberts, Blue Lake beans and cover seed crops, and also raises strawberries, hops, wheat and other grains, sugar beets, potatoes, green peas, fiber flax, dairy products, livestock and poultry.

Oregon's coast is lush and green with heavy rainfall and is noted for its scenic beauty. Crater Lake National Park, Mount Hood and Bonneville Dam on the Columbia are other tourist attractions.

With the low-cost electric power provided by Bonneville Dam, McNary Dam and other dams in the Pacific Northwest, Oregon has developed steadily as a manufacturing state. Leading manufactures are lumber and lumber products, metalwork, machinery, aluminum, chemicals, paper and food processing.

PENNSYLVANIA

Capital: Harrisburg.

Governor: George M. Leader, Dem. (to Jan. 1959).

Entered Union & (rank): Dec. 12, 1787 (2).

Present constitution adopted: 1874.

Motto: Virtue, liberty and independence.

State flower: Mountain laurel (1933).

State tree: Hemlock (1931).

State bird: Ruffed grouse (1931).

State colors: Blue and gold.

State song: None.

Nickname: Keystone State.

Origin of name: In honor of Adm. Sir William Penn, father of William Penn. It means "Penn's Woodland."

1940 population & (rank): 9,900,180 (2).

1950 population & (rank): 10,498,012 (3).

1956 estimated population: 10,964,000.

Area & (rank): 45,333 sq. mi. (32).

Geographic center: In Center Co., 2 1/2 mi. SW of Bellefonte.

Number of counties: 67.

Largest cities (1950 Census): Philadelphia (2,071,605); Pittsburgh (676,806); Erie (130,803); Scranton (125,536); Reading (109,320).

State forests: 20 (1,857,447 ac.).

State parks: 45 (72,000 ac.).

State revenue (Est. 1954-55): \$1,358,288,000.

State expenditure (Est. 1954-55): \$1,273,000,000.

From the steel mills of Pittsburgh through the mid-state coal mines and oil wells to the shipyards and factories of Philadelphia, Pennsylvania bristles with heavy industry. Approximately 30% of all American iron and steel is made in Pennsylvania. Other manufactures include locomotives, boilers, engines, blast furnaces, trucks, busses, wire, textiles, knit goods and nylon and rayon products. Virtually all of the U. S. anthracite (hard coal) deposits are located in Pennsylvania.

Agricultural products include apples, peaches, potatoes, corn, hay, barley, wheat, buckwheat and tobacco.

Pennsylvania is rich in historical lore. Philadelphia was the seat of the Federal government almost continuously from 1776 until 1800, and there the Declaration of Independence was signed and the Constitution drawn up. Valley Forge, of the Revolution, and Gettysburg, the turning-point of the Civil War, are both in Pennsylvania. The Liberty Bell stands in Independence Square in Philadelphia.

Henry Hudson sailed into Delaware Bay in 1609. In 1681, William Penn, the Quaker, founded its first colony.

RHODE ISLAND

Capital: Providence.

Governor: Dennis J. Roberts, Dem. (to Jan. 1959).

Entered Union & (rank): May 29, 1790 (13).

Present constitution adopted: 1843.

Motto: Hope.

State flower: Violet (unofficial).

State tree: Maple (unofficial).

State bird: Rhode Island Red (official).

State colors: Blue, white and gold (in state flag).

Song: "Rhode Island" (1946).

Nickname: Little Rhody.

Origin of name: From the Greek island of Rhodes.

1940 population & (rank): 731,346 (36).

1950 population & (rank): 791,896 (36).

1956 estimated population: 828,000.

Area & (rank): 1,214 sq. mi. (48).
 Geographic center: In Kent Co., 2.8 mi. S. by W. of Crompton.
 Number of counties: 5.
 Largest cities (1950 Census): Providence (248,674); Pawtucket (81,436); Cranston (55,060); Woonsocket (50,211); Warwick (43,028).
 State forests: 9 (15,600 ac.).
 State parks: 11 (5,700 ac.).
 State general revenue (1955): \$67,211,154.
 State general expenditure (1955): \$67,889,244.

Rhode Island, with the greatest density of population barring the District of Columbia, boasts the highest proportion of industrial workers of all the states. Leading industry is textiles, largely concentrated in Pawtucket, Providence and Woonsocket.

Providence is also one of the largest U. S. jewelry centers, and is important in the production of machinery and metal products.

With more than eight-tenths of the population living in urban areas, adjacent parts of the state are interested in dairying, poultry and truck farming. Nursery and greenhouse products and stock, potatoes, corn, apples, oats and hay lead the crop list. Of the state's land area, about one-seventh is farm cropland and open pasture; two-thirds is forested.

Newport is the site of the Naval War College and was long a show place for the luxurious summer homes built by some of New York's wealthiest people. The U. S. Naval Air Station is at Quonset in the town of North Kingstown.

Roger Williams founded Providence, and subsequently Rhode Island, in 1636 after he had been banished from Massachusetts for nonconformance to religious doctrine.

SOUTH CAROLINA

Capital: Columbia.
 Governor: George B. Timmerman, Jr., Dem. (to Jan. 1959).
 Entered Union & (rank): May 23, 1788 (8).
 Seceded from Union: Dec. 20, 1860.
 Re-entered Union: July 18, 1868.
 Present constitution adopted: 1895.
 Mottos: *Animus optibusque parati* (Prepared in mind and resources) and *Dum spiro spero* (While I breathe, I hope).
 State flower: Carolina yellow jessamine (1924).
 State tree: Palmetto tree (1939).
 State bird: Carolina wren (1948).
 State song: "Carolina" (1911).
 Nickname: Palmetto State.
 Origin of name: In honor of Charles II of England.
 1940 population & (rank): 1,899,804 (26).
 1950 population & (rank): 2,117,027 (27).
 1956 estimated population: 2,353,000.
 Area & (rank): 31,055 sq. mi. (39).
 Geographic center: In Richland Co., 13 mi. SE of Columbia.
 Number of counties: 46.
 Largest cities (1950 Census): Columbia (86,914); Charleston (70,174); Greenville (58,161); Spartanburg (36,795); Rock Hill (24,502).
 State forests: 4 (123,000 ac.).
 State parks: 22 (46,000 ac.).
 State total revenue (1955-56): \$178,050,102.
 State general expenditure (1955-56): \$168,226,280.

Once primarily agricultural, South Carolina has built so many big cotton textile mills that today the state's factories double the output of its farms in cash value. Agriculture has not, however, been completely replaced and today its chief crops are cotton, tobacco, peaches, corn, hay, oats, sweet potatoes and peanuts which are enhanced by the recent development of modern soil-conservation methods. Charleston makes asbestos, wood, pulp and steel products.

Civil War hostilities were started in this state at Charleston, when, on April 12, 1861, South Carolina men bombarded and captured Fort Sumter. In Charleston harbor the first submarine was used in warfare.

Vasquez de Ayllon, who came from Santo Domingo with about 500 settlers in 1526, made the first attempt to colonize this state but the expedition was later wiped out by Indians. In succeeding years, Spanish attempts were successful.

SOUTH DAKOTA

Capital: Pierre.
 Governor: Joseph J. Foss, Rep. (to Jan. 1959).
 Organized as territory: Mar. 2, 1861.
 Entered Union & (rank): Nov. 2, 1889 (40).
 Present constitution adopted: 1889.
 Motto: Under God the people rule.
 State flower: American pasqueflower (1903).
 State tree: Black Hills spruce (1947).
 State bird: Ring-necked pheasant (1943).
 State animal: Coyote (1949).
 State colors: Blue and gold (in state flag).
 State song: "Hail! South Dakota" (1943).
 Nicknames: Sunshine State; Coyote State.
 Origin of name: Same as for North Dakota.
 1940 population & (rank): 642,961 (38).
 1950 population & (rank): 652,740 (40).
 1956 estimated population: 696,000.
 Area & (rank): 77,047 sq. mi. (15).
 Geographic center: In Hughes Co., 8 mi. NE of Pierre.
 Number of counties: 68 (64 county governments).
 Largest cities (1950 Census): Sioux Falls (52,696); Rapid City (25,310); Aberdeen (21,051); Huron (12,788); Watertown (12,699).
 State forests: 4 (86,000 ac.).
 State parks: 10 (80,000 ac.).
 State general revenue (1955): \$79,472,099.
 State general expenditure (1955): \$78,995,108.†

*The acreage shown includes 46 recreation areas and 31 roadside parks in addition to the 10 state parks.

†Does not include \$8,934,000 in bond payments.

Seventy-five per cent of the population of South Dakota is actively interested in agriculture. Its leading crops are rye, barley, oats, corn, wheat. Cattle raising and dairying are its stronger industries. The richest U. S. gold mine, the Homestake, is at Lead.

The Black Hills, a great tourist attraction, are the highest mountains east of the Rockies. Mt. Rushmore, in this group, is celebrated for the likenesses of Washington, Jefferson, Lincoln and Theodore Roosevelt, which were carved in stone by the late Gutzon Borglum. The Badlands offer very scenic masses of bare rock and clay unrelieved by any vegetation. It was in this state that the Sioux Indians, angered at the influx of the white men who were search-

ing for gold, started the hostilities which ended in Custer's Massacre, on June 25, 1876, in Montana.

TENNESSEE

Capital: Nashville.

Governor: Frank G. Clement, Dem. (to Jan. 1959).

Entered Union & (rank): June 1, 1796 (16).

Seceded from Union: June 24, 1861.

Re-entered Union: July 24, 1866.

Present constitution adopted: 1870, amended for first time 1953.

Motto: Agriculture, commerce.

State flower: Iris (1933).

State tree: Tulip poplar (1947).

State bird: Mockingbird (1933).

Songs: "My Homeland, Tennessee" (1925) and "When It's Iris Time in Tennessee" (1935).

Nickname: Volunteer State.

Origin of name: From the name of the ancient capital of the Cherokee tribe.

1940 population & (rank): 2,915,841 (15).

1950 population & (rank): 3,291,718 (16).

1956 estimated population: 3,466,000.

Area & (rank): 42,246 sq. mi. (33).

Geographic center: In Rutherford Co., 5 mi. NE of Murfreesboro.

Number of counties: 95.

Largest cities (1950 Census): Memphis (396,000); Nashville (174,307); Chattanooga (131,041); Knoxville (124,769); Jackson (30,207).

State forests: 14 (154,752 ac.).

State parks: 18 (72,966 ac.).

State general revenue (1955-56): \$365,667,000.

State general expenditure (1955-56): \$317,603,000.

Tennessee won world prominence in 1945, for the atom bomb was made possible by the Clinton Engineer Works at Oak Ridge.

The state is now predominately industrial, with production including chemicals, food, textiles, virgin aluminum, shoes, lumber products, and metal work. Mineral products include phosphates, zinc, copper, lead, sinter iron, pyrites, high-grade pottery clay, coal and marble. Tennessee's agricultural production includes livestock, cotton, corn, tobacco, hay, dairy products, poultry and eggs.

Tennessee is the home of TVA which operates 29 dams and distributes power from 3 dams on the Cumberland River maintained by the Army Corps of Engineers. Benefits of flood control, navigation and electrical power reach into 6 other states (Kentucky, Alabama, North Carolina, Georgia, Virginia, and Mississippi). The Tennessee River, already the most completely used major river in the world, is insufficient to supply energy needs, and the power system is being doubled by use of steam generating plants.

TEXAS

Capital: Austin.

Governor: Price Daniel, Dem. (to Jan. 1959).

Entered Union & (rank): Dec. 29, 1845 (28).

Seceded from Union: Mar. 2, 1861.

Re-entered Union: Mar. 30, 1870.

Present constitution adopted: 1876.

Motto: Friendship.

State flower: Bluebonnet (1901).

State tree: Pecan (1919).

State bird: Mockingbird (1927).

State song: "Texas, Our Texas" (1930).

Nickname: Lone Star State.

Origin of name: From an Indian word meaning "friends."

1940 population & (rank): 6,414,824 (6).

1950 population & (rank): 7,711,194 (6).

1956 estimated population: 8,925,000.

Area & (rank): 267,339 sq. mi. (1).

Geographic center: In McCulloch Co., 20 mi. NE of Brady.

Number of counties: 254.

Largest cities (1950 Census): Houston (596,163); Dallas (434,462); San Antonio (408,442); Fort Worth (278,778); Austin (132,459).

State forests: 5 (6,510 ac.).

State parks: 48.

State revenue receipts (1955-56): \$913,422,792.

State governmental cost (1955-56): \$805,686,551.

Big, sprawling, vigorous Texas, comprising one-twelfth of the entire area of the United States, is the richest political subdivision in the world with the possible exception of the Russian Ukraine, and is the only state that may, by Congressional statute, divide into five parts if it so desires. There is very little possibility of this ever being done because Texas and Texans live by its bigness. Texas is a natural leader in oil, natural gas, cotton, cattle, helium, sulfur, sheep, wool, onions and turkeys.

The distance from El Paso to Beaumont is a greater distance than from New York to Chicago. Texas supports possibly the most ardent local enthusiasts in the nation, who are always quick to boast of her.

Over the Neches River, at Port Arthur, is the most elevated highway bridge over tidal waters in the world.

Cabeza de Vaca explored the state in 1528. Since 1685, it has been under the jurisdiction of 6 separate governments: those of France, Spain, Mexico, the Republic of Texas, the Confederacy and the United States.

UTAH

Capital: Salt Lake City.

Governor: George D. Clyde, Rep. (to Jan. 1961).

Organized as territory: Sept. 9, 1850.

Entered Union & (rank): Jan. 4, 1896 (45).

Present constitution adopted: 1896.

Motto: Industry.

State flower: Sego lily (1911).

State tree: Blue spruce (1933).

State bird: Seagull (1955).

State emblem: Beehive.

State song: "Utah, We Love Thee."

Nickname: Beehive State.

Origin of name: From the Ute tribe, meaning "people of the mountains."

1940 population & (rank): 550,310 (41).

1950 population & (rank): 688,862 (38).

1956 estimated population: 812,000.

Area & (rank): 84,916 sq. mi. (10).

Geographic center: In Sanpete Co., 3 mi. N of Mantle.

Number of counties: 29.

Largest cities (1950 Census): Salt Lake City (182,121); Ogden (57,112); Provo (28,937); Logan (16,832); Murray (9,006).

State forests: None.

State parks: 3 (10 ac.).

State general revenue (1954-55): \$110,629,406.*

State general expenditure (1954-55): \$115,672,422.*

* State began period with \$36,300,519 balance or surplus; finished with \$31,257,503.

Utah, rich in natural resources, has long been recognized for its copper, gold, silver, lead and zinc. Also, it produces all the elements necessary for the manufacture of steel: iron, lime, dolomite, fluorspar, manganese and coal for coking. Uranium mining has recently become a major industry. The state is also developing an oil industry, and this resource may become a major factor in Utah's economy.

Utah's crops requiring extensive irrigation include sugar beets, potatoes, hay, onions and wheat. Various garden crops, such as beans, peas and tomatoes, and fruits, such as pears, peaches, apples and apricots, make up an ever-growing industry. Eggs and commercial poultry are also among the products of Utah.

Brigham Young led the Mormons into the area in 1847. Six times in the next forty years, the area applied for statehood and was refused because polygamy was practiced. In 1896, when polygamy was abandoned by the Mormon Church, Utah was admitted into the Union.

Great Salt Lake, lying in the north central area, has long been a world wonder. It has no known outlet, and its salt content is about six times that of the ocean.

VERMONT

Capital: Montpelier.

Governor: Joseph B. Johnson, Rep. (to Jan. 1959).

Entered Union & (rank): Mar. 4, 1791 (14).

Present constitution adopted: 1793.

Motto: Vermont—freedom and unity.

State flower: Red clover (1894).

State tree: Sugar maple (1949).

State bird: Hermit thrush (1941).

State song: "Hail to Vermont" (1937).

Nickname: Green Mountain State.

Origin of name: From the French, meaning "green mountain."

1940 population & (rank): 359,231 (46).

1950 population & (rank): 377,747 (45).

1956 estimated population: 370,000.

Area & (rank): 9,609 sq. mi. (42).

Geographic center: In Washington Co., 4.5 mi. SSE of Roxbury Village.

Number of counties: 14.

Largest cities (1950 Census): Burlington (33,155); Rutland (17,659); Barre (10,922); Montpelier (8,599); St. Albans (8,552).

State forests: 26 (80,697 ac.).

State parks: 25 (6,641 ac.).

State revenue (1956): \$52,545,065.

State expenditure (1956): \$55,933,705.

Vermont, the only New England state without a seacoast (and the last to be settled because of this), leads the nation in

marble, granite, asbestos and maple syrup production. In ratio to population it keeps more dairy cows than any other state. Vermont's soil is devoted to dairying, truck farming and fruit growing, its rugged area precluding extensive farming. This same quality, however, along with a bracing dry climate, makes the state popular as a summer resort and as a center of winter sports. Two-thirds of the total land area of the state is classified as forest land.

From 1777 to 1791, Vermont was an independent state of indefinite status with some national perquisites and then was the first state after the original thirteen to join the Union. It was also the first state to forbid slavery and the first to adopt universal manhood suffrage (1777). Vermont has been Republican since 1854; only Georgia on the Democratic side ties that record for consistency.

VIRGINIA

Capital: Richmond.

Governor: Thomas B. Stanley, Dem. (to Jan. 1958).

Entered Union & (rank): June 25, 1788 (10).

Seceded from Union: Apr. 17, 1861.

Re-entered Union: Jan. 27, 1870.

Present constitution adopted: 1902.

Motto: *Sic semper tyrannis* (Thus always to tyrants).

State flower: American dogwood (1918).

State bird: Cardinal.

State song: "Carry Me Back to Old Virginny" (1940).

Nicknames: The Old Dominion; Cavalier State.

Origin of name: In honor of Elizabeth, "Virgin Queen" of England.

1940 population & (rank): 2,677,773 (19).

1950 population & (rank): 3,318,680 (15).

1956 estimated population: 3,651,000.

Area & (rank): 40,815 sq. mi. (35).

Geographic center: In Appomattox Co., 11 mi. S of E of Amherst.

Number of counties: 98, plus 32 independent cities.

Largest cities (1950 Census): Richmond (230,310); Norfolk (213,513); Roanoke (91,921); Portsmouth (80,039); Alexandria (61,787).

State forests: 6 (45,072 ac.).

State parks: 8 (24,073 ac.).

State revenue (1956): \$444,444,422.

State expenditure (1956): \$443,700,183.

The history of America is closely tied to that of Virginia, particularly in the colonial period. Jamestown, founded in 1607, was the first permanent English settlement in North America, and slavery was introduced there in 1619. The surrenders ending both the American Revolution and the Civil War occurred in Virginia. The state is called the "Mother of Presidents" because 8 chief executives of the U. S. were born there.

Points of historic interest include Mount Vernon and other places associated with Washington; Monticello, home of Jefferson; Stratford, home of the Lees; Richmond, capital of the Confederacy and of Virginia; and Williamsburg, the restored Colonial capital.

Among Virginia's natural wonders are the famous Natural Bridge and the limestone caverns of the Shenandoah Valley. The most important natural resources are beds of bituminous coal, forest lands, oyster beds and commercial fisheries.

Manufacturing includes chemicals, textiles, lumber and wood products, foods, transportation equipment (including shipbuilding), apparel and furniture. Agricultural products include livestock, poultry, dairy goods, tobacco, apples, grains and hay crops.

WASHINGTON

Capital: Olympia.

Governor: Albert D. Rosellini, Dem. (to Jan. 1961).

Organized as territory: Mar. 2, 1853.

Entered Union & (rank): Nov. 11, 1889 (42).

Present constitution adopted: 1889.

Motto: *Al-Ki* (Indian word meaning Bye and Bye).

State flower: Rhododendron (1949).

State tree: Hemlock (1947).

State bird: Goldfinch (1951).

State colors: Green and gold (1925).

State song: "Washington's Song" (1909).

Nicknames: Evergreen State; Chinook State.

Origin of name: In honor of Geo. Washington.

1940 population & (rank): 1,736,191 (30).

1950 population & (rank): 2,378,963 (23).

1956 estimated population: 2,651,900.

Area & (rank): 68,192 sq. mi. (19).

Geographic center: In Chelan Co., 10 mi. S of W of Wenatchee.

Number of counties: 39.

Largest cities (1950 Census): Seattle (467,591);

Spokane (161,721); Tacoma (143,673);

Yakima (38,486); Bellingham (34,112).

State forests: 2 (290,000 ac.).

State parks: 75 (65,667 ac.).

State revenue, all funds (1955-56): \$471,933,775.

State expenditures, all funds (1955-56): \$438,711,366.

Washington is one of the leaders in lumber production. Its rugged surface is rich in stands of Douglas fir, yellow and white pine, spruce, larch and cedar. The state's other first is apples. Food and lumber products and a wide variety of goods flow from Washington factories.

The Columbia River contains one third of the potential water power of America. Largest dam is Grand Coulee, greatest power producer in the world. Other mighty dams on the Columbia include Chief Joseph, Rock Island, Bonneville, McNary and The Dalles, which are shared with Oregon. There are 96 dams in Washington, built for various purposes including power, irrigation, flood control, water storage, etc.

The Hanford Engineer Works, north of Pasco, has been set up as the world's first full-scale plant for atom bombs.

WEST VIRGINIA

Capital: Charleston.

Governor: Cecil H. Underwood, Rep. (to Jan. 1961).

Entered Union & (rank): June 20, 1863 (35).

Present constitution adopted: 1872.

Motto: *Montani semper liberi* (Mountaineers always free).

State flower: Rhododendron (1903).

State tree: Sugar maple (1949).

State bird: Cardinal (1949).

State animal: Black bear.

State colors: Blue and gold (unofficial).

State songs: "West Virginia, My Home Sweet Home" (approved 1947 as one of songs of state); "West Virginia Hills" (by custom).

Nickname: Mountain State.

Origin of name: Same as for Virginia.

1940 population & (rank): 1,901,974 (25).

1950 population & (rank): 2,005,552 (29).

1956 estimated population: 1,983,000.

Area & (rank): 24,181 sq. mi. (40).

Geographic center: In Braxton Co., 4 mi. E of Sutton.

Number of counties: 55.

Largest cities (1950 Census): Huntington (86,353); Charleston (73,501); Wheeling (58,891); Clarksburg (32,014); Parkersburg (29,684).

State forests: 10 (96,418 ac.).

State parks: 21 (38,752 ac.).

State general revenue (1956-57): \$95,515,807.

State general expenditure (1956-57): \$92,922,304.

Mountainous West Virginia is the coal mining leader of the nation. The state also ranks high in steel, glass, aluminum and chemical manufacture, natural gas, oil, quarry products and hardwood lumber. Cattle is the main agricultural product. Leading crops include wheat, corn, oats, hay, tobacco and fruit.

West Virginia was created when its residents refused to secede from the Union and severed the state from Virginia during the Civil War era.

Like many mountain states, West Virginia has an equable climate without extremes. White Sulphur Springs, in Greenbrier County, is a famous health resort. Mountain streams give the state one of the highest U. S. water-power potentials.

WISCONSIN

Capital: Madison.

Governor: Vernon W. Thomson, Rep. (to Jan. 1959).

Organized as territory: Apr. 20, 1836.

Entered Union & (rank): May 29, 1848 (30).

Present constitution adopted: 1848.

Motto: Forward.

State flower: Violet.

State tree: Sugar maple.

State bird: Robin.

State animal: Wisconsin's official "wild life" animal is the white-tailed deer. The badger continues to be the "official state animal."

State fish: Musky (Muskellunge).

State song: "On Wisconsin" (unofficial).

Nickname: Badger State.

Origin of name: French corruption of an Indian word meaning "gathering of waters."

1940 population & (rank): 3,137,587 (13).

1950 population & (rank): 3,434,575 (14).

1956 estimated population: 3,764,000.

Area & (rank): 56,154 sq. mi. (25).

Geographic center: In Wood Co., 9 mi. SE of Marshfield.

Number of counties: 71.

Largest cities (1950 Census): Milwaukee (637,392); Madison (96,056); Racine (71,193); Kenosha (54,368); Green Bay (52,735).

State forests: 8 (294,721 ac.).

State parks: 30 (18,037 ac.).

State total net revenue, all funds (1955-56): \$463,927,167.

State total net expenditure, all funds (1955-56): \$446,755,046.

Wisconsin leads the U. S. in milk and cheese production. In 1955, the state produced 13% of the nation's total output of milk. Other important farm products are: potatoes, cabbage, maple sugar, cranberries and cherries. The state ranks first in producing peas, corn and beets for canning.

About 40 years ago Wisconsin's forests became exhausted, but in recent years phenomenal strides in reforestation have been made. The chief industrial products of the state are automobiles, machinery, furniture, paper and beer.

Wisconsin pioneered in social legislation, providing pensions for the blind (1907), aid to dependent children (1913) and old-age assistance (1925). In 1932, it was the first state to enact an unemployment compensation law. In labor legislation, the state has also pioneered in important laws, among them the first workmen's compensation law actually to take effect. Wisconsin had the first state-wide primary-election law and the first successful income-tax law.

WYOMING

Capital: Cheyenne.

Governor: Millward L. Simpson, Rep. (to Jan. 1959).

Organized as territory: July 25, 1868.

Entered Union & (rank): July 10, 1890 (44).

Present constitution adopted: 1890.

Motto: *Cedant arma togae* (Let arms yield to the gown).

State flower: Indian paintbrush (1917).

State tree: Cottonwood (1947).

State bird: Meadow lark (1927).

State insignia: Bucking horse (unofficial).

State song: "Wyoming State Song" (unofficial).

Special legal holiday: Arbor Day (by governor's designation).

Nickname: Equality State.

Origin of name: From the Indian, meaning "mountains and valleys alternating"; named after the Wyoming Valley in Pa.

1940 population & (rank): 250,742 (47).

1950 population & (rank): 290,529 (47).

1956 estimated population: 321,000.

Area & (rank): 97,914 sq. mi. (8).

Geographic center: In Fremont Co., 58 mi. N of E of Lander.

Number of counties: 23, plus Yellowstone National Park.

Largest cities (1950 Census): Cheyenne (31,935); Casper (23,673); Laramie (15,581); Sheridan (11,500); Rock Springs (10,857).

State forests: None.

State parks: 2 (1,060 ac.).

State general revenue (1949-50): \$42,246,000.

State general expenditure (1949-50): \$41,618,000.

Wealthy in wool, cattle, oil and coal, Wyoming was first in U. S. history to insure woman's place in politics. In 1869, it gave women the vote and Mrs. Nellie Tayloe Ross, who held office in 1925-27, was the first U. S. woman governor.

Second in mean elevation to Colorado, Wyoming has many lures for the tourist trade, notably Yellowstone National Park. Cheyenne is famous for its annual "Frontier Days" celebration, which brings in visitors from everywhere. One of the world's largest subbituminous coal fields lies near Gillette. Big game hunting is good in many parts of the state.

SELF-GOVERNING U. S. TERRITORIES

ALASKA

Capital: Juneau.

Governor: Michael A. Stepovich (to Apr. 1961).

Organized as territory: 1912.

Territorial flower: Forget-me-not.

Territorial bird: Willow ptarmigan.

Territorial song: "Alaska's Flag."

Origin of name: Corruption of native word meaning "great country."

1939 population: 72,524.

1950 population: 128,643.

1955 estimated population: 209,000.

1939-50 population change: +77.4%.

Area: 586,400 sq. mi. (incl. Aleutians).

Geographic center (including islands): 95 mi. south of Fort Gibbon.

Largest cities (estimated 1955): Anchorage (30,000); Fairbanks (10,500); Ketchikan (7,500); Juneau (6,200).

"Seward's Folly" in 1867, when that Secretary of State arranged for its purchase from Russia for \$7,200,000. Since then Alaska has returned approximately \$3,500,000,000 worth of products to the U. S.

Canned salmon is Alaska's principal product. It mines gold, supplies all domestically mined U. S. tin and also turns out platinum, coal, antimony, silver, mercury, tungsten and chromium.

The Pribilof Islands, in the Bering Sea, are famous as the breeding ground of the Alaska fur seal, which is under careful government control. Beaver, muskrat, otter, mink and other furs also abound. Alaska's first pulp mill at Ketchikan, constructed at a cost of \$54 million, began operation in 1954.

Mt. McKinley, in the south central part, is 20,300 feet high, the tallest peak in North America. With its wild interior, still partly unexplored, this territory is a hunter's paradise. With only one person for every four square miles, Alaska is by far the most thinly

Alaska, the biggest of U. S. possessions (including the Aleutian Islands) was called

settled of U. S. lands. Sitka was its capital until 1912.

Alaska has magnificent glaciers and active volcanoes. Winter temperatures in the interior have been known to register 78° below zero. However, summer temperatures in the same area have been recorded at 99° above zero; and large parts of the territory, especially in the southeast, enjoy mild climate in both summer and winter.

Alaska's Governor is appointed by the President to a 4-year term, and there is a locally elected 2-house legislature. The territory's elected delegate to the U. S. House of Representatives has floor privileges but no vote. Legislation is pending in Congress for the admission of Alaska as a state.

The Aleutians include the following island groups (and major islands): Fox Islands (Unimak, Akutan, Unalaska, Umnak); Islands of the Four Mountains (Chuginadak, Kagamil, Carlisle, Herbert); Andreanof Islands (Atka, Tanaga, Adak, Kanaga); Rat Islands (Kiska, Amchitka, Semisopochnoi, Rat); Near Islands (Agattu, Attu). In June 1942, the Japanese occupied Attu and Kiska. However, Attu was retaken by the U. S. in May 1943; Kiska was evacuated by the Japanese in Aug. 1943 after extensive shelling and bombing of the island.

Vitus Bering, a Dane working for the Russians, and Alexei Chirikov discovered Alaska and the Aleutians in 1741.

HAWAII

Capital: Honolulu (on Oahu).

Governor: William F. Quinn.

Organized as territory: 1900.

Motto: *Ua Mau Ke Ea O Ka Aina I Ka Pono*
(The life of the land is preserved by righteousness).

Territorial flower: Hibiscus.

Territorial song: "Hawaii Pono!" (unofficial).

Territorial bird: Nene (Hawaiian goose).

Nickname: Paradise of the Pacific.

1940 population: 423,300.

1950 population: 499,794.

1940-50 population change: +18.1%.

1957 estimated population: 539,309.

Area: 6,454 sq. mi. (incl. outlying islands).

Counties: 4.

Largest cities (1950 Census): Honolulu (248,034); Hilo (27,198); Wahiawa (8,369), Kailua-Lanikai (7,740); Wailuku (7,424).

Hawaii, 2,100 miles west-southwest of San Francisco, is a 390-mile chain of islets and 8 main islands—Hawaii, Kahoolawe, Maui, Lanai, Molokai, Oahu, Kauai, and Niihau. Kure (Ocean) Island, an uninhabited islet in the Leeward Islands, and Palmyra, in the Line Islands, are administratively part of Hawaii.

Hawaii's temperature is mild and the soil is fertile for tropical fruits and vegetables. Cane sugar and pineapple are its chief products, approximately 75% of the world's canned pineapple being produced in the islands. Hawaii also grows coffee, rice, bananas, nuts and potatoes. Some livestock and poultry are raised. The tourist business is Hawaii's fourth largest source of income. Approximately 85% of the island's population, although racially heterogeneous, is native to the U. S.

Hawaii's highest peak, Mauna Kea, rises to 13,784 feet and is, in a sense, the world's highest mountain since it springs from an ocean floor 18,000 feet below sea level. Kilauea, on Hawaii, is one of the world's most active volcanoes. The islands have no snakes and their only native mammal is a small bat, of which there are many species.

Hawaii's Governor is appointed by the President to a 4-year term, and there is a locally elected 2-house legislature. The territory's delegate to the U. S. House of Representatives has floor privileges but no vote. Legislation is pending in Congress for the admission of Hawaii as a state.

Hawaii was discovered in 1778 by Captain James Cook, an Englishman, who named it the Sandwich Islands. It was ruled by native monarchs until 1893, thereafter as a republic until 1898, when it ceded itself to the U. S.

COMMONWEALTH OF PUERTO RICO

Capital: San Juan.

Governor: Luis Muñoz Marín, Pop. Dem. (to Jan. 1961).

Song: "La Borinqueña."

1940 population: 1,869,255.

1950 population: 2,210,703.

1940-50 population change: +18.3%.

1957 estimated population: 2,302,000.

Area: 3,423 sq. mi.

Largest cities (1950 Census): San Juan (357,205*); Ponce (99,492); Mayagüez (58,944); Caguas (33,759); Arecibo (28,659).

* Includes Río Piedras (182,438), which was annexed in 1954.

Puerto Rico is an island about 100 mi. long and 35 mi. wide at the northeastern end of the Caribbean Sea. It is a self-

governing Commonwealth freely and voluntarily associated with the U. S. Under its Constitution, a Governor and a Legislative Assembly are elected by direct vote for a 4-year period. The judiciary is vested in a Supreme Court and lower courts established by law. The people elect a Resident Commissioner to the U. S. House of Representatives, where he has a voice but no vote. The island was formerly an unincorporated territory of the U. S. after being ceded by Spain as a result of the Spanish-American War.

The Commonwealth is one of the most densely populated areas of the world, with about 674 inhabitants per square mile. However, it has one of the highest standards of living in Latin America. Featuring Puerto

Rican economic development is Operation Bootstrap. This program has established some 500 new factories and has greatly increased agricultural production, transportation and communications facilities, electric power, housing, etc. Life expectancy was ex-

panded from 46 to 63 years during 1940-50. School enrollment has been doubled.

Columbus discovered the island on his second voyage to America in 1493. Ponce de León settled it for Spain by 1508, and became its first governor in 1510.

NON SELF-GOVERNING U. S. TERRITORIES

AMERICAN SAMOA

Capital: Pago Pago (on Tutuila Island).

Governor: Peter Tali Coleman.

1940 population: 12,908.

1950 population: 18,937.

1956 population: 20,154.

Area: 75.3 sq. mi.

American Samoa, a group of 5 volcanic islands and 2 coral atolls located some 2,400 miles south of Hawaii in the South Pacific Ocean, is administered by the Interior Dept.

By the Treaty of Berlin signed Dec. 2, 1899, and ratified Feb. 16, 1900, the U. S. was internationally acknowledged to have rights extending over all the islands of the Samoa group east of longitude 171° west of Greenwich. On Apr. 17, 1900, the chiefs of Tutuila and Aunu'u ceded those islands to the U. S. In 1904, the King and chiefs of Manu'a ceded the islands of Ofu, Olosega and Tau (composing the Manu'a group) to the U. S. Swains Island, some 200 miles north of Samoa, was included as part of the territory by Act of Congress Mar. 4, 1925; and on Feb. 20, 1929, Congress formally accepted sovereignty over the entire group and placed the responsibility for administration in the hands of the President. From 1900-51, by Presidential direction, the Department of the Navy governed the territory. On July 1, 1951, administration was transferred to the Department of the Interior.

The principal products are copra, mats, handicrafts and canned fish.

BAKER, HOWLAND AND JARVIS

These Pacific islands were not to play a role in the extraterritorial plans of the U. S. until May 13, 1936, when the U. S. perfected its claim. President F. D. Roosevelt, at that time, placed them under the control of and jurisdiction by the Secretary of the Interior for administration purposes.

Baker Island is a saucer-shaped atoll with an area of approximately one square mile and an elevation of 20 feet. It is about 1,650 miles from Hawaii.

Howland Island, 36 miles to the northeast, is approximately one and a half miles long and half a mile wide and rises to an elevation of 18 feet.

Jarvis Island is several hundred miles to the east and is approximately two miles long by one and an eighth miles wide.

CANAL ZONE

Headquarters: Balboa Heights, C. Z.; 21 West St., New York City; 425 Thirteenth St., N. W., Washington, D. C.

Governor-President: Major Gen. William H. Potter.

1940 population: 51,827.

1954 population: 38,953.

Area: 648.01 sq. mi.

The Canal Zone is a 50-mile strip between the Atlantic and Pacific Oceans which was granted to the U. S. by the Republic of Panamá by treaty in 1903 (ratified Feb. 26, 1904). It extends roughly 5 miles on either side of the center line of the Panama Canal.

The 1903 treaty provided for the payment of \$10,000,000 by the U. S. to Panamá upon ratification of the treaty and \$250,000 in gold annually, beginning 9 years after ratification. The annual payments were increased to \$430,000 after the U. S. went off the gold standard. The annuity was increased to \$1,930,000 by the 1955 treaty.

The history of the Canal goes back to 1534, when King Charles V of Spain ordered a survey made. Construction of the waterway was formally inaugurated in Jan. 1880 by the French Canal Co. under a concession granted by New Granada (Colombia) 2 years earlier. The canal rights and properties of the second French Canal Co. were bought by the U. S. for \$40,000,000, the transfer being made May 4, 1904, in Panama City. The construction was completed 10 years later.

The Canal is 40.27 miles from shore line to shore line and 50.72 miles from deep water in the Caribbean to deep water in the Pacific. The Panama Railroad, completed in 1855, is owned by the Panama Canal Co. It roughly parallels the Canal channel, running 47.64 miles from Colón to Panama City and is the oldest transcontinental railroad in the Americas.

The Panama Canal Locks, which provide a water bridge between the two oceans, are Gatún Locks on the Atlantic side and Pedro Miguel and Miraflores Locks on the Pacific side. They lift or lower ships 85 feet between sea level and Gatún Lake level in 3 steps on each side of the Isthmus. Each of the twin chambers in every flight of locks has a usable length of 1,000 feet, and width of 110 feet, and is about 70 feet deep.

The Canal Zone is, in effect, a government reservation, and in general no private enterprise is permitted except that relating directly to the operation of the waterway. The Governor, who is appointed by the U. S. President, administers the Canal Zone Government, which is charged with the civil government, including health, sanitation and protection of the Zone. The Governor is also ex officio President of the Panama Canal Company, which is a corporate agency of the U. S. charged with the operation of the Canal and related business activities.

CANTON AND ENDERBURY

Canton and Enderbury islands, the largest of the Phoenix group, are jointly owned and supervised by the U. S. and Great Britain after an agreement signed on Apr. 6, 1939. Canton is triangular in shape and the largest of the eight islands of this group. It lies approximately 1,600 miles southwest of Hawaii in the Pacific and was discovered at the turn of the eighteenth century by U. S. whalers. It was surveyed by Commander R. W. Meade who named it after a whaler ship. It had, in 1955, a population of 279, including Europeans. Enderbury is rectangular in shape and is 2.7 miles long by one mile wide. It is unpopulated and lies about 32 miles southeast of Canton.

GUAM

Capital: Agaña.

Governor: Richard Barrett Lowe.

1940 population: 22,290.

1950 population: 59,498.

1957 estimated population: 70,000.

Area: 225 sq. mi.

Guam, the largest of the Mariana Islands, is independent of the trusteeship assigned to the U. S. in 1947. It was acquired by the U. S. from Spain in 1898 (occupied 1899) and was placed under the Navy Department.

In World War II, Guam was seized by the Japanese on Dec. 11, 1941; but on July 27, 1944, it was once more in U. S. hands.

On Aug. 1, 1950, President Truman signed a bill which granted U. S. citizenship to the people of Guam and established self-government. However, the people do not have an elected representative in Washington, D.C., and they do not vote in national elections. The civilian Governor operates under the Department of the Interior.

Guam farmers raise all crops indigenous to a subtropical climate.

Added stimulus to Guam's economy was given by the development in 1950 of a commercial port at Apra Harbor.

JOHNSTON ISLAND

This island was originally discovered by Captain Charles James Johnston of *H.M.S. Cornwallis* on Dec. 14, 1807. On July 27, 1858, it was claimed by Hawaii and became a possession of the U. S. The island is about 600 miles southwest of Hawaii and about 1½ miles long by half a mile wide.

KINGMAN REEF

This reef was discovered by Captain W. E. Kingman in Nov. 1853 and is the smallest land of U. S. sovereignty. It is 150 feet long by 120 feet wide at high tide. At low tide, two other islets of this atoll appear. It is approximately 1,000 miles south of Hawaii.

KURE (OCEAN) ISLAND. See HAWAII

MIDWAY

Midway, lying about 1,200 miles west-northwest of Hawaii, was discovered by Captain N. C. Brooks of the Hawaiian bark

Gambia on July 5, 1859, in the name of the U. S. It was formally declared a U. S. possession in 1867, and in 1903 Theodore Roosevelt made it a naval reservation.

Sand and Eastern Islands, with 850 acres and 328 acres respectively, are its largest individual islands. In 1935 Midway became a stopover for commercial transpacific flights. Commercial activities ceased in 1950.

The total group comprises an area of 28 square miles and has no native population. The Navy Dept. maintains an installation and, with the Civil Aeronautics Administration, has jurisdiction over the island.

PALMYRA. See HAWAII**VIRGIN ISLANDS OF THE U. S.**

Capital: Charlotte Amalie (on St. Thomas).

Governor: Walter A. Gordon.

1940 population: 24,889 (St. Croix, 12,902; St. Thomas, 11,265; St. John, 722).

1950 population: 26,665.

1940-50 population change: +7.1%.

1956 estimated population: 30,261.

Area: 133 sq. mi. (St. Croix, 82; St. Thomas, 32; St. John, 19).

The Virgin Islands, consisting of 9 main islands and some 75 islets, were discovered by Columbus in 1493. Since 1666, England has held 6 of the main islands; the other 3 (St. Croix, St. Thomas and St. John), as well as about 50 of the islets, were eventually acquired by Denmark, which named them the Danish West Indies. In 1917, these islands were purchased by the U. S. from Denmark for \$25 million.

Congress granted U. S. citizenship to Virgin Islanders in 1927; and, in 1931, administration was transferred from the Navy to the Department of the Interior. Universal suffrage was given in 1936 to all persons who could read and write the English language. The Governor is appointed by the President of the U. S.

About 85% of the population is Negro, and there is limited farming, fishing and cattle raising. Vegetables, citrus fruits and coconuts are raised, and the chief items of export are sugar, rum and bay rum. Tourism is the principle industry.

WAKE ISLAND

Wake Island, about halfway between Midway and Guam, is actually the three islets of Wilkes, Peale and Wake. They were discovered by the British in 1796 and annexed by the U. S. in 1898. The entire area comprises four square miles. In 1938, Pan American Airways established a seaplane base and it has been used as a commercial base since then. On Dec. 8, 1941, it was attacked by the Japanese, who finally took possession on Dec. 23. It was surrendered by the Japanese on Sept. 4, 1945. On Oct. 15, 1950, it was the scene of a conference between President Truman and General MacArthur.

The Civil Aeronautics Administration maintains a station on the island and has jurisdiction, with the Navy, over the island. There is no native population.

U. S. Trusteeships

In 1885, Germany assumed a protectorate over the Marshall Islands; and, in 1899, she purchased the Northern Mariana and Caroline Islands from Spain. These islands were occupied by the Japanese in 1914 and were mandated to Japan by the League of Nations in 1919. On Apr. 2, 1947, the U. N. Security Council approved a trusteeship agreement proposed by the U. S. under which the Northern Mariana, Caroline and Marshall Islands became a Strategic Trust Territory under the administration of the U. S. The measure was approved by the President, with the agreement of Congress, on July 18, 1947. Administration was transferred from the Navy to the Department of the Interior on July 1, 1951. However, administration of Saipan and Tinian was transferred back to the Navy on Jan. 1, 1953. On July 17 of the same year, administration of the remaining islands of the Northern Marianas, with the exception of Rota, was also transferred back to the Navy.

The entire group comprises more than 2,000 islands, but the total land area is only 687 sq. mi., many of the islands being only tiny coral reefs. The Micronesians are the main cultural group, the inhabitants of the Northern Marianas being most advanced.

MARIANA ISLANDS

The Mariana Islands, east of the Philippines and south of Japan, include the islands of Guam, Rota, Saipan, Tinian, Pagan, Guguan, Agrihan and Aguijan. Guam, the largest, is independent of the trusteeship, having been acquired by the U. S. from Spain in 1898. (For information on Guam, see page 237.)

Chief crops are copra and fresh fruits and vegetables.

CAROLINE ISLANDS

The Caroline Islands, east of the Philippines and south of the Marianas, include the Yap, Truk and Palau groups and the islands of Ponape and Kusale, as well as many coral atolls.

The islands are composed chiefly of volcanic rock, and their peaks rise 2,000 to 3,000 feet above sea level. Chief exports of the islands are copra, trochus and handicrafts.

MARSHALL ISLANDS

The Marshall Islands, east of the Carolines, are divided into two chains: the western or Ralik group, including the atolls Jaluit, Kwajalein, Wotho, Bikini and Eniwetok; and the eastern or Ratak group, including the atolls Mili, Majuro, Maloelap, Wotje and Likiep.

The islands are of the coral-reef type and rise only a few feet above sea level. The chief crop is coconuts; exports include copra, tortoise shell, mother-of-pearl, etc.

Bikini and Eniwetok have been the scene of several atom-bomb tests.

Islands Under Provisional U. S. Administration

In accordance with the Japanese peace treaty signed Sept. 8, 1951, the U. S. may propose that the U. N. assign to it, as a trusteeship, the following former Japanese territory: the Ryukyu Islands south of 29° n. lat. (largest: Okinawa); the Bonin Islands (largest: Chichi Jima); the Volcano Islands

(including Iwo Jima); Rosario Island; Parece Vela; and Marcus Island. It was also agreed in the treaty that, until such trusteeship is actually granted, the U. S. will administer the islands. As of Sept. 1956, no action had been taken by the U. S. toward bringing about this trusteeship.

THE 50 LARGEST CITIES OF THE CONTINENTAL U. S.

Since we planned the INFORMATION PLEASE ALMANAC as a book of national scope and interest, we avoided emphasis on and identification with a single city or state, as has been characteristic of all almanacs heretofore. To obtain accurate and authoritative information we have gone to the city officials. We appreciate their co-operation.

AKRON, OHIO

Incorporated as city: 1865.
Mayor-Manager: Leo Berg (to Dec. 1957).
1940 population & (rank): 244,791 (38).
1950 population & (rank): 274,605 (39).
1940-50 population change: +12.2%.
1950 land area: 53.7 sq. mi.
Altitude: 1,081 ft.
Location: In NE part of state, on Little Cuyahoga River.
County: Seat of Summit Co.
Churches: 260 of all denominations.
City-owned parks: 73 (4,400 ac.).

Immigration by Country of Origin, 1820 to 1956

Source: Immigration and Naturalization Service.

(Figures are totals, not annual averages, and were tabulated as follows: 1820-67, alien passengers arrived; 1868-91 and 1895-97, immigrant aliens arrived; 1892-94 and 1898 to present, immigrant aliens admitted. Data before 1906 relate to country whence alien came; since 1906, to country of last permanent residence.)

¹ Include reported annulments. ² Leaders (...) indicate data unavailable. ³ Divorced persons may remarry each other at any time. ⁴ At discretion of court. ⁵ Incomplete. ⁶ 2 yr. if cause for divorce occurred outside D. C. ⁷ Estimated. ⁸ For husband; 10 mo. for wife. In case of adultery, guilty party cannot marry accomplice. ⁹ At discretion of court; or in case of children under 18, 6-mo. waiting period. ¹⁰ Until court is adjourned that grants the divorce. Court may prohibit defendant in adultery cases from remarrying. ¹¹ Action for divorce may be maintained where: (1) both parties were residents of state when offense was committed; (2) parties were married within state; (3) plaintiff was resident of state when offense was committed and is resident when action is commenced; (4) offense was committed within state and injured party is resident of state when action is commenced. ¹² By modification of decree by court. ¹³ Party guilty of adultery may never marry the correspondent. ¹⁴ In case of adultery, guilty party may not marry, except to innocent party, until death of innocent party. ¹⁵ Period may be shortened by court. ¹⁶ 2 years if residence is acquired after cause of divorce action arose. No residence required in case of adultery if personal service can be had within state. ¹⁷ Attorney can lengthen waiting period if desired. ¹⁸ Unless otherwise set out by judge. ¹⁹ For cruelty only, but technically not usually observed. ²⁰ Servicemen acquire residence by being continuously stationed at military base in state for 1 year. ²¹ Must have resided in county for 3 mo. ²² 3-mo. period between first and final judgment; in Utah, 90 days between first and final judgment, during which parties must consult counseling services. ²³ If complainant is a resident, and defendant is non-resident but within jurisdiction of court, no specific residence period is required.

¹ Per cent single within specified year of age in 1950, in 3½% sample of population. ² Per cent of persons single at beginning of year of age who marry during that year and all later years. NOTE: "Single" means those never married; that is, it excludes widowed and divorced. Hence, "marriage prospects" refers to likelihood of first marriage only.

NOTE: Birth order refers to number of children born alive to mother. Figures are shown to the last digit as computed for convenience in summation. They are not assumed to be accurate to the last digit. Figures for births of order not stated are distributed, including births that occurred in Massachusetts, which did not require the reporting of birth order. Rates are live births per 1,000 female population aged 15-44 years in each specified group. Population enumerated as of April 1 for 1940 and 1950, and estimated as of July 1 for 1943-49 and 1951-54. Births are adjusted for under-registration. ¹ Based on data from a 50% sample.

NOTE: Births are adjusted for underregistration. Figures are shown to the last digit as computed for convenience in summation. They are not assumed to be accurate to the last digit. Figures for age of mother not stated are distributed. Rates are live births per 1,000 female population in each specified group, enumerated as of April 1 for 1940 and 1950, and estimated as of July 1 for 1943-49 and 1951-54. Figures for age of mother not stated are distributed. ¹ Rates computed by relating total births, regardless of age of mother, to female population aged 15-44 years. ² Rates computed by relating births to mothers 45 years and over, to female population aged 45-49 years. ³ Based on data from a 50% sample.

* Rates per 1,000 live births. † Less than .05. ‡ 1922-24. § Not available. NOTE: Rates per 100,000 population. The figures beginning with 1940 relate to the total United States; for earlier periods the figures relate to the Death Registration States. The death rates for 1950 are shown on the basis of both the Fifth and the Sixth Revision of the International List of Causes of Death. Because of radical changes from the Fifth to the Sixth Revisions, the death rates are not strictly comparable. Death rates for 1956 are based upon the Sixth Revision; 1956 figures are estimates.

Death Rates by Marital Status, Age, and Sex; U. S., Annual Average for 1949-51

One Accidental Death Every 6 Minutes in 1956

Source: National Safety Council.

The nation's 1956 accident totals can be figured at the following approximate rates:

Class of accident	One every	Class of accident	One every
All accidents	Deaths 6 minutes	Workers off-job	Deaths 16 minutes
	Injuries 3 seconds		Injuries 13 seconds
Motor-vehicle	Deaths 13 minutes	Home	Deaths 19 minutes
	Injuries 23 seconds		Injuries 8 seconds
Work	Deaths 37 minutes	Public non-motor-vehicle	Deaths 33 minutes
	Injuries 16 seconds		Injuries 16 seconds

Motor-Vehicle Deaths by Type of Accident, 1913 to 1956

1955.....	8,200	13,000	1,490	15	450	100	1,600	13,550	38,426
1956.....	7,950	13,850	1,280	10	480	140	1,650	14,650	40,000

* The proportion of deaths allocated to fixed-object collisions and noncollision accidents is different from that reported by most states. State reports generally indicate that many accidents involving no collision on the roadway are classified as fixed-object collisions because the motor vehicle collides with an object after leaving the roadway.

† The totals do not quite equal the sum of the various types because the estimates were generally made only to the nearest 10 deaths, and to the nearest 50 deaths for certain types.

Motor-Vehicle Traffic Deaths by States, 1955-56

Methods of Execution in the United States

Source: Information Please Almanac questionnaires to the states.

State	Method	State	Method
Alabama	Electrocution	New Mexico	Lethal gas
Arizona	Lethal gas	New York	Electrocution
Arkansas	Electrocution	North Carolina	Lethal gas
California	Lethal gas	North Dakota	No death penalty
Colorado	Lethal gas	Ohio	Electrocution
Connecticut	Electrocution	Oklahoma	Lethal gas ¹
Delaware	Hanging	Oregon	Lethal gas ²
D. C.	Electrocution	Pennsylvania	Electrocution
Florida	Electrocution	Rhode Island	No death penalty
Georgia	Electrocution	South Carolina	Electrocution
Idaho	Hanging	South Dakota	Electrocution
Illinois	Electrocution	Tennessee	Electrocution
Indiana	Electrocution	Texas	Electrocution
Iowa	Hanging	Utah	Hanging
Kansas	Hanging		or shooting ³
Kentucky	Electrocution	Vermont	Electrocution
Louisiana	Electrocution	Virginia	Electrocution
Maine	No death penalty	Washington	Hanging
Maryland	Lethal gas	West Virginia	Electrocution
Massachusetts	Electrocution	Wisconsin	No death penalty
Michigan	No death penalty	Wyoming	Lethal gas
Minnesota	No death penalty	U. S. (Fed. Gov't.)	(⁴)
Mississippi	Lethal gas	Alaska	No death penalty
Missouri	Lethal gas	American Samoa	Hanging
Montana	Hanging	Canal Zone	Hanging
Nebraska	Electrocution	Guam	Hanging
Nevada	Lethal gas	Hawaii	No death penalty
New Hampshire	Hanging	Puerto Rico	No death penalty
New Jersey	Electrocution	Virgin Islands	Hanging ⁵

¹ Electrocution until gas chamber is provided. ² A measure to abolish death sentence will be voted on in the next general election. ³ Condemned man has choice. ⁴ Method shall be that used by state in which sentence is imposed. ⁵ In St. Croix only. NOTE: Method shown with each state is maximum penalty for murder and certain other crimes. In most states having capital punishment, jury or judge can specify whether sentence shall be death or life imprisonment.

EDUCATION

Elementary and Secondary Public School Statistics, 1955-56

Source: Information Please Almanac Questionnaire.

Note: The number of schools includes rural and one-room school houses. The number of pupils includes only full-time students. The average yearly expenditure is based on the average daily attendance.

Accredited U. S. Colleges and Universities

Spring Semester, 1957

Only schools fully accredited by at least one of the six regional accrediting associations are listed. The number of students is for matriculated undergraduate and graduate students who are working for a degree.

Institution, location and (date founded)	Chief executive ¹	Students ²	Control ³
Abilene Christian College; Abilene, Tex. (1906).....	Don H. Morris.....	2,075 C	Private
Adams State College; Alamosa, Colo. (1921).....	Fred J. Plachy.....	705 C	State
Adelphi College; Garden City, N. Y. (1896).....	Paul D. Eddy.....	2,443 C	Private
Agnes Scott College; Decatur, Ga. (1889).....	Wallace M. Alston.....	601 F	Presbyterian ⁴
Agricultural, Mechanical and Normal College; Pine Bluff, Ark. (1875)	Lawrence A. Davis, Sr.....	1,036 C	State
Akron, University of; Akron, Ohio (1870).....	Norman P. Auburn.....	4,561 C	City
Alabama, University of; University, Ala. (1831).....	James H. Newman.....	6,890 C	State
Alabama A & M College; Normal, Ala. (1875).....	J. F. Drake.....	1,093 C	State
Alabama College; Montevallo, Ala. (1896).....	F. Edward Lund.....	615 C	State
Alabama Polytechnic Institute; Auburn, Ala. (1872).....	Ralph B. Draughon.....	7,256 C	State
Alabama State College; Montgomery, Ala. ⁷	H. C. Trenholm.....	2,864 C	State
Alabama State Teachers College; Florence, Ala. (1872).....	E. B. Norton.....	1,298 C	State
Alabama State Teachers College; Jacksonville, Ala. (1883).....	Houston Cole.....	2,098 C	State
Alabama State Teachers College; Livingston, Ala. (1835).....	D. P. Culp.....	462 C	State
Alabama State Teachers College; Troy, Ala. (1887).....	C. B. Smith.....	1,081 C	State
Alaska, University of; College, Alaska (1922).....	E. N. Patty.....	507 C	Territory
Albany State College; Albany, Ga. (1903).....	William H. Dennis, Jr.....	498 C	State
Albertus Magnus College; New Haven, Conn. (1925).....	Sister Marie Louise.....	290 F	Catholic ⁴
Albion College; Albion, Mich. (1835).....	William W. Whitehouse.....	1,239 C	Methodist ⁴
Albright College; Reading, Pa. (1856).....	Harry V. Masters.....	655 C	Evan. Un. Breth. ⁴
Alcorn A & M College; Lorman, Miss. (1871).....	John D. Boyd.....	715 C	State
Alfred University; Alfred, N. Y. (1836) ²⁴	M. Ellis Drake.....	1,224 C	Private
Allegheny College; Meadville, Pa. (1815).....	Lawrence L. Pelletier.....	998 C	Methodist ⁴
Allen University; Columbia, S. C. (1870).....	Frank R. Veal.....	787 C	A.M.E.
Alliance College; Cambridge Springs, Pa. (1912).....	A. P. Coleman.....	192 C	Private
Alma College; Alma, Mich. (1886).....	Robert D. Swanson.....	683 C	Presbyterian
Alverno College; Milwaukee, Wis. (1890).....	Sister M. Augustine.....	789 F	Catholic ⁴
American International College; Springfield, Mass. (1885).....	John F. Hines.....	1,093 C	Private
American University; Washington, D. C. (1839).....	Hurst R. Anderson.....	5,408 C	Methodist

¹ President, unless otherwise indicated. ² M—Male; F—Female; C—Coeducational; Co—Co-ordinate. ³ Control, unless otherwise indicated. ⁴ Affiliated but not controlled. ⁵ Enrollment includes women who are admitted for special courses and/or graduate work. ⁶ Enrollment includes men who are admitted for special courses and/or graduate work. ⁷ Fall 1955. ⁸ Fall 1956. ⁹ Spring 1956. ¹⁰ Rector. ¹¹ Chancellor. ¹² Dean. ¹³ Managing Director. ¹⁴ Acting President. ¹⁵ Interim President. ¹⁶ Acting Chancellor. ¹⁷ Provost. ¹⁸ Director. ¹⁹ Acting Director. ²⁰ Acting Dean. ²¹ Superintendent. ²² Dean of the Faculty. ²³ Chairman, Administrative Committee. ²⁴ Includes New York State College of Ceramics, a contract unit of the State University of New York and an integral part of Alfred University. ²⁵ Barnard College is the women's undergraduate school of Columbia University. ²⁶ Jewish-sponsored; non-sectarian program. ²⁷ Pembroke College is the undergraduate school for women of Brown University. ²⁸ Duplicates deducted. ²⁹ Including Hastings College of the Law. ³⁰ Acting Provost. ³¹ Also campuses at San Dimas and Pomona. ³² Affiliated with Congregational, Baptist and Episcopal churches. ³³ Formerly Colorado A & M College. ³⁴ Formerly Wisconsin State College; made a division of the University of Wisconsin in 1956. ³⁵ Cornell University also operates the New York State Agricultural Experiment Station in Geneva, N. Y., and the Cornell Aeronautical Laboratory in Buffalo, N. Y. ³⁶ Rutgers College is for men only; Douglass College, formerly New Jersey State College for Women, is for women only; campuses at Newark and Camden are coeducational. ³⁷ Quasi-public in control. ³⁸ Fontbonne, Maryville and Webster Colleges are corporate colleges of St. Louis University. ³⁹ Hobart College is for men; William Smith College is for women. ⁴⁰ Legally public; administered and financed privately. ⁴¹ Formerly Polytechnic Institute of Puerto Rico. ⁴² Jackson College is Dept. of Women (Lib. Arts) for Tufts University. ⁴³ Teachers Institute and Seminary College are coeducational; Rabbinical School and Cantors Institute are male only. ⁴⁴ College is independent; theological seminary has Presbyterian affiliation. ⁴⁵ Co-educational in evening; men only during day. ⁴⁶ Mary Washington College is the constituent women's college of the University of Virginia. ⁴⁷ Professional schools located at Baltimore; Maryland State College located at Princess Anne. ⁴⁸ A division of the University of Maryland. ⁴⁹ Branch campus at Sault Ste. Marie, Mich. ⁵⁰ Formerly Michigan State College. ⁵¹ A branch of University of Minnesota at Minneapolis. ⁵² There are also campuses at St. Paul and Duluth. ⁵³ New Church (Swedenborgian). ⁵⁴ Female only at Park Ave. bldg.; coeducational at Bronx bldg. ⁵⁵ State support for teacher education. ⁵⁶ Will admit first students in September 1957. ⁵⁷ Newcomb College is constituent school for women of Tulane University. ⁵⁸ Year of consolidation. ⁵⁹ Maintained by individual Christian Scientists for sons and daughters of Christian Scientists. ⁶⁰ Affiliated with Harvard University. ⁶¹ Radford College is the women's division of Virginia Polytechnic Institute. ⁶² Affiliated with Methodist, Congregational and Presbyterian Churches. ⁶³ Formerly St. Paul's Polytechnic Institute. ⁶⁴ Snow College and College of Southern Utah are branches of Utah State Agricultural College. ⁶⁵ Until July 1, 1957. ⁶⁶ Includes Utica College, Utica, N. Y. ⁶⁷ Other campuses are located at El Paso, Galveston, Houston and Dallas. ⁶⁸ Does not include enrollment of Texas Western College at El Paso. See that entry. ⁶⁹ Part of University of Texas. ⁷⁰ President of Union College and Chancellor of Union University. ⁷¹ Control passing from City to State over 3-year period which began July 1, 1956. ⁷² Administrator. ⁷³ Formerly Oklahoma Agricultural and Mechanical College. ⁷⁴ Permanent site, now under construction, will be 7 mi. N of Colorado Springs. ⁷⁵ Total authorized strength is 2,496.

GEOGRAPHY

Miscellaneous Data

Source: U. S. Geological Survey.

Highest point: Mt. Whitney, Calif.*	14,495 ft.
Lowest point: Death Valley, Calif.*	282 ft. below sea level
Most northern point: Lake of the Woods projection, Minn.	49° 23' 04.5" N. lat.
Most southern point: Cape Sable, Fla.	25° 07' N. lat.
Most eastern point: West Quoddy Head, Maine	66° 57' W. long.
Most western point: Cape Alava, Wash.	124° 44' W. long.
Places farthest apart: Point Arena, Calif., to West Quoddy Head, Maine	2,897 mi.
Geographic center: near Lebanon, Smith County, Kans.	{ 39° 50' N. lat. 98° 35' W. long.
Northern boundary: Canada and Great Lakes	3,987 mi.
Southern boundary: Mexico	2,013 mi.

* The highest and lowest points in the U. S. are 86 mi. apart.

The Continental Divide

The Continental Divide is a ridge of high ground which runs irregularly north and south through the Rocky Mountains and separates eastward-flowing from westward-flowing streams. The waters which flow eastward empty into the Atlantic Ocean, chiefly by way of the Gulf of Mexico; those which flow westward empty into the Pacific.

Forest Resources of the United States

Source: U. S. Forest Service.

Nearly 1/3 of the U. S. is forest land including over 800 different kinds of trees. Commercial areas include land capable of producing timber of commercial quantity and quality, and available now or prospectively for such use. Almost all the old-growth forest is in the West. Noncommercial areas include alpine, semidesert, chaparral and other forest types of low timber productivity, though much of it is important for watershed protection.

U. S. Forest Land in Acres, 1953

Old growth	46,055,000
Young growth saw timber	132,561,000
Pole timber stands	169,408,000
Seedling and sapling stands	94,709,000
Nonstocked and other areas	41,607,000
Total, commercial forest land	484,340,000
Noncommercial forest	163,346,000
Total, all forest land	647,686,000

Rivers of the U. S.

Source: U. S. Geological Survey.

(300 or more miles long)

ALABAMA (315 mi.): From junction of Tallapoosa R. and Coosa R. in Alabama to junction with Tombigbee R. to form Mobile R. and Tensaw R.

ALLEGHENY (325 mi.): From Potter Co. in Pennsylvania to junction with Monongahela R. at Pittsburgh to form Ohio R.

ALTAMAHA-OCMULGEE (392 mi.): From junction of Yellow R. and South R., Newton Co. in Ga. to Atlantic Ocean.

APALACHICOLA-CHATTAHOOCHEE (500 mi.): From Towns Co. in Ga. to Gulf of Mexico in Fla.

ARKANSAS (1,450 mi.): From Lake Co. in Colorado to Mississippi R. in Arkansas.

BIG BLACK (330 mi.): From Webster Co. in Mississippi to Mississippi R.

BIG HORN (336 mi.): From junction of Popo Agie R. and Wind R. in Wyoming to Yellowstone R. in Montana.

BRAZOS (870 mi.): From junction of Salt Fork and Double Mountain Fork in Texas to Gulf of Mexico.

CANADIAN (906 mi.): From Colfax Co. in New Mexico to Arkansas R. in Oklahoma.

CEDAR (329 mi.): From south central Minnesota to Iowa R. in Iowa.

CIMARRON (600 mi.): From Colfax Co. in New Mexico to Arkansas R. in Okla.

CLARK FORK-PEND OREILLE (505 mi.): From Silver Bow Co. in Mont. to Columbia R. in B. C.

COLORADO (1,440 mi.): From Grand Co. in Colorado to Gulf of California in Mexico.

COLORADO (840 mi.): From Dawson Co. in Texas to Matagorda Bay.

COLUMBIA (1,214 mi.): From Columbia Lake in British Columbia to Pacific Ocean between Oregon and Washington.

CONNECTICUT (407 mi.): From Connecticut Lakes in New Hampshire to Long Island Sound in Connecticut.

CUMBERLAND (687 mi.): From junction of forks in Harlan Co. in Kentucky to Ohio R.

DAKOTA (Sometimes called **JAMES**) (710 mi.): From Wells Co. in North Dakota to Missouri R. in South Dakota.

DES MOINES (327 mi.): From junction of forks in Humboldt Co. in Iowa to Mississippi R.

GILA (630 mi.): From southwest New Mexico to Colorado R. in Arizona.

GREEN (360 mi.): From Lincoln Co. in Kentucky to Ohio R. in Indiana.

GREEN (730 mi.): From Sublette Co. in Wyoming to Colorado R. in Utah.

HUDSON (306 mi.): From Essex Co. in New York to Upper New York Bay between New York and New Jersey.

JAMES (340 mi.): From junction of Jackson R. and Cowpasture R. in Virginia to Chesapeake Bay.

LITTLE COLORADO (300 mi.): From Apache Co. in Arizona to Colorado R.

LITTLE MISSOURI (560 mi.): From northeast Wyoming to Missouri R. in North Dakota.

MILK (625 mi.): From Glacier Co. in Montana to Missouri R.

MINNESOTA (332 mi.): From Big Stone Lake between Minnesota and South Dakota to Mississippi R. at St. Paul.

MISSISSIPPI (2,470 mi.): From Lake Itasca in Minn. to Gulf of Mexico in La.

MISSOURI (2,466 mi.): From junction of Jefferson R., Madison R., and Gallatin R. in Montana to Mississippi R. near St. Louis.

NEOSHO (460 mi.): From Morris Co. in Kansas to Arkansas R. in Oklahoma.

NIORARA (431 mi.): From Niobrara Co. in Wyoming to Missouri R. in Nebraska.

NORTH CANADIAN (760 mi.): From Union Co. in New Mexico to Canadian R. in Oklahoma.

NORTH PLATTE (618 mi.): From Jackson Co. in Colorado to junction with So. Platte R. in Nebraska to form Platte R.

NUCES (338 mi.): From near Edwards-Real Co. border in Texas to Nueces Bay.

OHIO (981 mi.): From junction of Allegheny R. and Monongahela R. at Pittsburgh to Mississippi R. between Illinois and Kentucky.

OSAGE (500 mi.): From junction of Elm Creek and Onion Creek in Kansas to Missouri R. in Missouri.

OUACHITA (605 mi.): From Polk Co. in Arkansas to Red R. in Louisiana.

PEARL (490 mi.): From Neshoba Co. in Mississippi to Gulf of Mexico between Mississippi and Louisiana.

PECOS (735 mi.): From Mora Co. in New Mexico to Rio Grande in Texas.

PEE DEE-YADKIN (435 mi.): From Watauga Co. in N. C. to Winyah Bay in S. C.

PLATTE (310 mi.): From junction of North Platte R. and South Platte R. in Nebraska to Missouri below Omaha.

POWDER (375 mi.): From junction of forks in Johnson Co. in Wyoming to Yellowstone R. in Montana.

RED (1,018 mi.): From junction of forks in Tillman Co. in Oklahoma to Mississippi R. in Louisiana.

RED (Sometimes called **RED RIVER OF THE NORTH**) (545 mi.): From junction of Otter Tail R. and Bois de Sioux R. in Minnesota to Lake Winnipeg in Manitoba.

REPUBLICAN (445 mi.): From eastern Colorado to junction with Smoky Hill R. in Kansas to form Kansas R.

RIO GRANDE (1,885 mi.): From San Juan Co. in Colorado to Gulf of Mexico between Texas and Mexico.

ROANOKE (380 mi.): From junction of forks in Montgomery Co. in Virginia to Albemarle Sound in North Carolina.

ROCK (300 mi.): From Washington Co. in Wisconsin to Mississippi R. in Illinois.

SABINE (380 mi.): From junction of forks in Hunt Co. in Texas to Sabine Lake between Texas and Louisiana.

SACRAMENTO (382 mi.): From Siskiyou Co. in California to Suisun Bay.

SAINT FRANCIS (425 mi.): From Iron Co. in Missouri to Mississippi R. in Arkansas.

SALMON (420 mi.): From Custer Co. in Idaho to Snake R.

SAN JOAQUIN (350 mi.): From junction of forks in Madera Co. in California to Suisun Bay.

SAN JUAN (360 mi.): From Archuleta Co. in Colorado to Colorado R. in Utah.

SANTEE-WATEREE-CATAWBA (538 mi.): From McDowell Co. in N. C. to Atlantic Ocean in S. C.

SAVANNAH (314 mi.): From junction of Tugaloo R. and Seneca R. in South Carolina to Atlantic Ocean between Georgia and South Carolina.

SMOKY HILL (540 mi.): From Cheyenne Co. in Colorado to junction with Republican R. in Kansas to form Kansas R.

SNAKE (1,038 mi.): From Yellowstone National Park in Wyoming to Columbia R. in Washington.

SOUTH PLATTE (424 mi.): From Park Co. in Colorado to junction with North Platte R. in Nebraska to form Platte R.

SUSQUEHANNA (444 mi.): From Otsego Co. in New York to Chesapeake Bay in Maryland.

TALLAHATCHIE (301 mi.): From Tippah Co. in Mississippi to junction with Yazoo R. to form Yazoo R.

TENNESSEE (652 mi.): From junction of Holston R. and French Broad R. near Knoxville to Ohio R. in Kentucky.

TOMBIGBEE (409 mi.): From junction of forks near Amory, Mississippi, to junction with Alabama R. in Alabama to form Mobile R. and Tensaw R.

TRINITY (360): From junction of forks in Kaufman Co. in Texas to Galveston Bay.

WABASH (475 mi.): From Darke Co. in Ohio to Ohio R. between Illinois and Indiana.

WASHITA (500 mi.): From Hemphill Co. in Texas to Red R. in Oklahoma.

WHITE (690 mi.): From Madison Co. in Arkansas to Mississippi R.

WISCONSIN (430 mi.): From Vilas Co. in Wisconsin to Mississippi R.

YELLOWSTONE (671 mi.): From Park Co. in Wyoming to Missouri R. in North Dakota.

* Figures are lengths of general outline of seacoast. Measurements made with unit measure of 30 minutes of latitude on charts as near scale of 1:1,200,000 as possible. Shoreline of bays and sounds is included to point where they narrow to width of unit measure, and distance across at such point is included. † Measurements made with unit measure of 3 statute miles on charts of 1:200,000 and 1:400,000 scale when available. Shoreline of bays, sounds and other bodies of water included to point where they narrow to width of 3 statute miles, and distance across at such point is included. ‡ Figures obtained in 1939-40 with recording measure on largest scale maps and charts then available. Shoreline of bays, sounds and other bodies of water included to head of tide-water, or to point where they narrow to width of 100 feet.

WEATHER AND CLIMATE

Devastating North Atlantic Hurricanes of the 20th Century

The following is a selected list of North Atlantic hurricanes based on casualties, damage and general public interest. Facts about each storm are taken from Weather Bureau records, although in some cases only estimates of wind speed are available. Data given in this list pertain only to U. S. land areas except where indicated otherwise.

Date	Areas hardest hit	Land stations with highest wind speed	Deaths (U. S. only)	Est. damage (millions)	Remarks
1900, Sept. 8.....	Galveston, Tex.	Galveston, Tex. (120* mph)	6,000	\$ 20	Damage due to both winds and storm wave. Galveston Is. inundated.
1909, Sept. 10-12....	La.; Miss.	New Orleans, La. (68 mph)	350	5	Winds 50-75 mi. W of New Orleans, where deaths occurred, were much stronger than 68 mph.
1915, Aug. 5-24.....	East Tex.; La.	Galveston, Tex. (120 mph)	275	50	Water 5-6 ft. deep in Galveston business district. 90% of homes demolished. Warnings issued well ahead of time.
1915, Sept. 22-Oct. 2..	Mid-Gulf Coast	Burrwood, La. (140 mph)	275	13	Many casualties due to persons insisting on staying in low-lying areas despite warnings.
1919, Sept. 2-14.....	Fla.; La.; Tex.	Sand Key, Fla. (84† mph)	284	22	488 persons drowned at sea.
1926, Sept. 6-22.....	Fla.; Ala.	Miami Beach, Fla. (132 mph)	100	105	Most deaths were in Miami area. Said to have been one of most destructive storms of century.
1928, Sept. 6-20.....	Southern Fla.	Lake Okeechobee, Fla. (75† mph)	1,836	25	1,870 injured. Nearly all deaths were in Lake Okeechobee area. Winds estimated as high as 160 mph caused Lake to overflow into populated areas.
1935, Aug. 31-Sept. 8..	Southern Fla.	Tampa, Fla. (75 mph)	376	6	Sustained winds over Florida Keys est. 150-200 mph. Remembered as "Labor Day Storm," one of most violent on record.
1935, Oct. 30-Nov. 8...	Southern Fla.	Miami, Fla. (75 mph)	5	6	Called "The Yankee Storm" because it moved in from N. E. It was of small diameter and its wind covered only narrow band.
1938, Sept. 16-22....	Long Island, N. Y. Southern New Eng.	Blue Hills Obs., Mass. (186 mph)	600	250	Unusually destructive. Storm center moved as fast as 56 mph at times. 1,754 injured. Damage est. as high as \$330 million.
1940, Aug. 5-15.....	Ga.; S. C.; N. C.	Savannah, Ga. (73 mph)	50	3	30 of deaths were due to disastrous flooding inland as far west as Tennessee.
1944, Sept. 8-16.....	N. C. to New England	Cape Henry, Va. (134 mph)	46	100	344 deaths at sea. Shipping lanes were crowded with war-time activity.
1944, Oct. 13-21.....	Fla. to Carolinas	Dry Tortugas Is. (120 mph)	18	100	About 300 were killed in Cuba area before storm reached U. S. Evacuation of thousands from threatened areas in Fla. prevented higher toll.
1945, Aug. 24-29.....	Texas	Seadrift, Tex. (135 mph)	3	20	Several other coastal localities recorded 135 mph. One of most intense hurricanes in Texas.
1945, Sept. 11-19.....	Fla.; Ga.; S. C.	Carysfort Reef Light, Fla. (138 mph)	4	60	22 casualties in Bahamas. Damage mostly in Dade Co., Fla. Evacuation of 50,000 persons prevented heavier loss of life.

Date	Areas hardest hit	Land stations with highest wind speed	Deaths (U. S. only)	Est. damage (millions)	Remarks
1947, Sept. 10-19.....	Fla.; Mid-Gulf Coast	Hillsboro Light, Fla. (155 mph)	51	110	Damage especially heavy along Gulf Coast. Onshore winds resulted in high water.
1949, Aug. 23-29.....	Fla. to Carolinas	Jupiter, Fla. (153 mph)	2	52	Center of storm crossed Lake Okeechobee. Levees held back water, which rose 12 ft. (Compare casualties with 1928.)
1950, Oct. 15-19.....	Florida	Miami, Fla. (122 mph)	4	28	"KING"—small but violent storm. Struck Miami, then moved up Florida peninsula.
1954, Aug. 26-31.....	N. C. to Maine	Block Island, R. I. (135 mph)	60	461	"CAROL"—more damage than any other single storm on record for U. S. Water and high waves flooded low-lying areas 1,000 injuries in Long Island-New England area.
1954, Sept. 6-11.....	N. J. to Maine	Blue Hill Obs., Mass. (101 mph)	21	43	"EDNA"—wind est. up to 135 mph at Massachusetts Bay.
1954, Oct. 5-16.....	S. C. to N. Y.	(See Remarks)	95	252	"HAZEL"—several N. C. localities had winds of 130-150 mph with unusually heavy wave damage resulting. Est. 400-1,000 casualties in Haiti. In Canada there were 78 deaths, mostly due to flooding.
1955, Aug. 11-13.....	N. C. to Pa. and N. Y.	Ft. Macon, N. C. (100 mph)	25	46	"CONNIE"—center passed over Morehead City and Beaufort flooding these cities. 12.35 in. of rain in New York City.
1955, Aug. 17-19.....	N. C. to New England	Wilmington, N. C. (74 mph)	184	832	"DIANE"—worst floods in history in Southern New England. 16 in. of rain in Hartford area.
1955, Sept. 19-20.....	North Carolina	Beaufort, N. C. (120* mph)	7	88	"IONE"—center passed over Morehead City and Beaufort but lost force rapidly thereafter. Recurved to sea south of Norfolk.
1956, Sept. 24-26.....	Northwest Florida	Burrwood, La. (84 mph)	15	25	"FLOSSY"—center passed in northeasterly direction over Burrwood, La., at 4 a.m. and over Pensacola, Fla., at 3 p.m. on Sept. 24. Lost force rapidly thereafter, but dumped heavy rains in southeastern states.
1957, June 26-28.....	Southwest Texas and Southwest Louisiana	Lake Charles, La. (97 mph)	353	150	"AUDREY"—gave an early start to the hurricane season and wiped out Cameron, La. Two weeks later "BERTHA," a less destructive tropical storm, struck in exactly the same area.

* Estimated. † Wind measuring equipment disabled at speed indicated.

Tropical Storms and Hurricanes, 1887-1956

	Jan.-Apr.	May	June	July	Aug.	Sept.	Oct.	Nov.	Dec.	Total
No. of tropical storms.....	3	10	31	38	126	185	130	29	3	555
No. of tropical storms which reached hurricane intensity.....	2	2	14	20	94	115	63	11	1	322

NOTE: Storms are listed under the month in which they were first observed. Exception: "ALICE," 1955 (Dec. 30, 1954-Jan. 5, 1955) is carried as a Jan. storm.

Groups of Tornadoes That Caused Outstanding Damage

Patents

Source: Patent Office.

A patent, in the most general sense, is a document issued by a government, conferring some special right or privilege. The term is now restricted mainly to patents for inventions; occasionally, land patents.

The grant of a patent for an invention gives the inventor the privilege, for a limited period of time, of excluding others from practicing a certain art or from making, using, or selling a certain article. However, it does not give him the right to make, use, or sell his own invention if it is an improvement on some unexpired patent whose claims are infringed thereby.

In the U. S., the law provides that a patent may be granted, for a term of 17 years, to any person who has invented or discovered any new and useful art, machine, manufacture, or composition of matter, as well as any new and useful improvements thereof. A patent may also be granted to a person who has invented or discovered and asexually reproduced a new and distinct variety of plant (other than a tuber-propagated one) or has invented a new, original and ornamental design for an article of manufacture.

A patent is granted only upon a regularly

filed application, complete in all respects; upon payment of the fees; and upon determination that the disclosure is complete and that the invention is new and useful. The disclosure must be of such nature as to enable others to reproduce the invention.

A complete application, which must be addressed to the Commissioner of Patents, Washington, D. C., consists of a petition, specification and claims, oath, drawing (whenever the nature of the case admits of it) and a filing fee of \$30 for cases having 20 claims or less. An additional fee of \$1 per claim is required for cases having more than 20 claims. The filing fee is not returned to the applicant if the patent is refused. If the patent is allowed, another fee of \$30 (and \$1 each for claims allowed in excess of 20) is required before the patent is issued. The fees for design patents vary.

Applications are considered in the order in which they are received. Patents are not granted for printed matter, for methods of doing business or for devices for which claims contrary to natural laws are made. Applications for a perpetual-motion machine have been made from time to time, but until a working model is presented that actually fulfills the claim, no patent will be issued.

Trademarks

Source: Patent Office.

A trademark may be defined as a word, letter, device or symbol, as well as some combination of these, which is used in connection with merchandise and which points distinctly to the origin or ownership of it.

Certificates of registration of trademarks are issued under the seal of the Patent Office and may be registered by the owner if he is engaged in interstate or foreign commerce, since any Federal jurisdiction over trademarks arises under the commerce clause of the Constitution. Trademarks may be registered by foreign owners who comply with our law, as well as by citizens of foreign countries with which the U. S. has treaties relating to trademarks. American citizens may register trademarks in foreign

countries by complying with the laws of those countries. The right to registration and protection of trademarks in many foreign countries is guaranteed by treaties.

General jurisdiction in trademark cases is given to the Federal courts. Decisions of examiners on applications or oppositions are subject to appeal to the Commissioner of Patents and from him to the U. S. Court of Customs and Patent Appeals. Before adopting a trademark, a person should make a search of prior marks in order to avoid infringing unwittingly upon them.

The duration of a trademark registration is 20 years, but it may be renewed indefinitely for 20-year periods, provided the trademark is still in use at the time of expiration.

Copyrights

Source: Copyright Office.

A copyright is a statutory right obtained by authors, musicians and artists or their assigns, upon compliance with the provisions of the copyright law, to prevent the reproduction of their works without their consent. The U. S. Constitution (Article I, Section 8) empowers Congress "to promote the progress of science and useful arts, by securing for limited times to authors and inventors the exclusive right to their respective writings and discoveries." The copyright owner possesses the exclusive right to print, reprint, publish, copy and vend the copyrighted work. Among some of the other rights possessed by the copyright owner are the exclusive rights to translate and dramatize literary works, to control public performance of dramas, and, in the case of nondramatic literary works and musical compositions, to control public performance for profit. Special provisions in regard to mechanical reproductions of musical compositions are included. Copyright protection extends to books; pamphlets; periodicals and contributions to periodicals; lectures, sermons, and monologues; dramas and dramatical musical compositions; musical compositions; maps; works of art or models and designs for works of art; reproductions of a work of art; drawings or plastic works of scientific or technical character; photographs, prints, and pictorial illustrations; commercial prints and labels; and motion pictures.

Copyright term endures 28 years from date of registration in the Copyright Office for unpublished material and from the date of publication for published works. The copyright may be renewed for an additional period of 28 years, provided application for such renewal is made within one year prior to the date of expiration of the original term. The copyright of a book or similar publication is secured by publication of such work after printing on the title page, or the page immediately following, the required copyright notice. This notice consists of the word *Copyright* or the abbreviation *Copr.*, the year of publication, and the name of the copyright owner. It is important to bear in mind that copyright comes into being at the time of first publication if this required notice appears on the work. If publication occurs without this notice, the work falls into the public domain, and the Copyright

Office cannot register the claim. In short, the Copyright Office does not grant copyrights; the obtaining of such protection depends on whether or not the claimant follows the statutory formalities at the time of publication. In view of the fact that those formalities vary with the different classes of works subject to copyright, persons interested in securing copyright should obtain circular No. 35 from the Register of Copyrights, Library of Congress, Washington 25.

The law requires that, promptly after the work has been published, two copies thereof (foreign works, one copy) must be promptly deposited in the Copyright Office. These copies should be accompanied by the proper application form and the statutory fee of \$4. If the work is a commercial print or label used with the sale or advertisement of an article of merchandise, the fee is \$6.

Effective June 3, 1949, the term of ad interim protection for books and periodicals in the English language first published abroad was extended to five years. Such works may be imported into the U. S. up to a total of 1,500 copies after ad interim registration has been obtained. The above amendment to the law also affords to the foreign author or publishers an option of obtaining registration without payment of the usual statutory fee if an extra copy of the work, accompanied by a catalogue card, is submitted to the Copyright Office within six months of first publication abroad.

The Act of Aug. 31, 1954, modified a number of existing formalities, primarily with regard to certain foreign works, and was designed to implement the Universal Copyright Convention, which was ratified by the Senate on June 25, 1954, and took effect on Sept. 16, 1955. One principal modification is that U. S. authors and publishers may use the symbol © instead of the word *Copyright* or the abbreviation *Copr.* The symbol must be accompanied by the year date of first publication and the name of the copyright claimant. The use of this form may obtain automatic copyright protection in member countries of the Universal Copyright Convention.

Application forms, etc., may be obtained free from the Copyright Office. Bulletin 14, the U. S. copyright law, can be purchased from the Register of Copyrights for 25¢.

¹ A—reasonable and proper; B—lower speed at night and on old highways; C—55 mph on 4-lane highways; D—50 mph pf at night; E—55 mph on dual-lane highways; F—50 mph at night; G—60 mph where marked; H—45 mph at night; I—55 mph at night; J—parkways to 55 mph where marked; K—unless otherwise marked; L—60 mph at night; pf—prima facie limit; FML—fixed maximum limits. ² Applies to nonresidents. The term "reciprocal" means that the state will extend to a nonresident the identical privileges granted by his home state to nonreciprocal motorists. In some states, visitors must register with a specified time. In most states, persons who intend to reside permanently must buy new plates and secure new driving license at once, or within a limited time. Acquisition of employment or placing children in public school is often considered intention to reside permanently. ³ Registry tax on first registration. ⁴ Visitor's permit required after 10 days. ⁵ Daytime; 55 mph at night. ⁶ Sales or use tax on new cars, first registration of used cars. ⁷ Three months before current registration expires. ⁸ Bill of sale must be filed. ⁹ Excise tax. ¹⁰ Public liability insurance required after 30 days. ¹¹ State has compulsory insurance. ¹² Visitors must register immediately. ¹³ Until home-state license plates expire. ¹⁴ Extension granted. ¹⁵ Nebraska operator's license required in 30 days. ¹⁶ \$15 maximum. ¹⁷ Visitors must register within 15 days. ¹⁸ For automobiles; busses license required in 30 days. ¹⁹ State has "Unsatisfactory Judgment Fund" law. ²⁰ Nonresident car must bear valid registration plates of place of residence of owner. ²¹ It is a traffic offense to drive unreasonably slow. ²² Unless otherwise posted; trucks and busses 45 mph. ²³ Passenger vehicles; trucks 45 mph. ²⁴ In accord with posted limits. ²⁵ Not to exceed 6 months when employed in state. ²⁶ At discretion of Secretary of State. ²⁷ No limit, unless residence is established or employment accepted; Nevada license must then be secured immediately.

The National Park System of the United States

Source: National Park Service.

The National Park System of the United States, administered by the National Park Service, a bureau of the Department of the Interior, embraces a total of 177 areas, containing approximately 22,373,000 acres in federal ownership. Started with the establishment of Yellowstone National Park in 1872, the system includes not only the most extraordinary and spectacular scenic exhibits in the United States proper and in Alaska and Hawaii but also a large number of sites distinguished for their historic or prehistoric importance or scientific interest. The number and extent of the various types of areas which comprise the system, as of December 31, 1956, are as follows:

Type of Area	Number	Federal land (acres)	Lands within exterior boundaries not federally owned (acres)	Total lands within exterior boundaries (acres)
National Parks	29	13,130,737.79	421,769.01	13,552,506.80
National Historical Parks	8	31,976.17	5,447.75	37,423.92
National Monuments	83	8,957,441.08	187,781.44	9,145,222.52
National Military Parks	11	24,542.31	2,342.63	26,884.94
National Memorial Parks	1	68,466.53	1,907.77	70,374.30
National Battlefield Parks	3	5,516.25	2,177.84	7,694.09
National Battlefield Sites	5	188.63	547.35	735.98
National Historic Sites	10	1,354.07	2.12	1,356.19
National Memorials	12	4,426.18	58.13	4,484.31
National Cemeteries	10	215.10	5.00	220.10
National Seashore Recreational Area	1	24,705.23	3,794.77	28,500.00
National Parkways	3	84,554.97	28,228.95	112,783.92
National Capital Parks	1	38,487.69	1,446.30	39,933.99
Total, National Park System	177	22,372,612.00	655,509.06	23,028,121.06

¹ Includes Catotchin Mountain Park, Chesapeake and Ohio Canal, Prince William Forest Park, Baltimore-Washington Parkway, Suitland Parkway among the 792 units administered by National Capital Parks.

National Parks

Name; location and year established as National Park	Area in U. S. ownership, acres	Outstanding characteristics
Acadia (Maine), 1919	30,651.44	Rugged seashore on Mt. Desert Island and adjacent mainland
Big Bend (Texas), 1944	694,224.70	Mountains and desert bordering the Rio Grande
Bryce Canyon (Utah), 1928	36,010.38	Area of grotesque eroded rocks brilliantly colored
Carlsbad Caverns (N. Mex.), 1930	45,846.59	One of the world's largest known caves; spectacular flight of bats.
Crater Lake (Oregon), 1902	160,290.33	Deep blue lake in crater of inactive volcano
Everglades (Florida), 1947	1,258,639.73	Sub-tropical area with abundant bird and animal life
Glacier (Montana), 1910	999,566.80	Rocky mountains with many glaciers and lakes
Grand Canyon (Arizona), 1919	673,108.31	Mile deep gorge, 4 to 18 miles wide, 217 miles long (105 in park).
Grand Teton (Wyoming), 1929	299,935.05	Picturesque range of high mountain peaks
Great Smoky Mts. (N. C.-Tenn.), 1930	507,644.06	Highest mountain range east of Black Hills; luxuriant plant life
Hawaii (Territory Hawaii), 1916	187,480.61	Spectacular volcanic area with two active volcanoes
Hot Springs (Arkansas), 1921	986.11	47 mineral hot springs said to have therapeutic value
Isle Royale (Michigan), 1940	539,338.51	Largest wilderness island in Lake Superior; great moose herd
Kings Canyon (California), 1940	453,718.38	Huge canyons; high mountains; giant sequoias
Lassen Volcanic (California), 1916	104,480.68	Only recently active volcano in United States proper
Mammoth Cave (Kentucky), 1936	50,695.73	Vast limestone labyrinth with underground river
Mesa Verde (Colorado), 1906	51,017.87	Best preserved pre-historic cliff dwellings in United States
Mount McKinley (Alaska), 1917	1,939,319.04	Highest mountain in North America; spectacular wildlife
Mount Rainier (Washington), 1899	241,571.09	Greatest single-peak glacial system in United States
Olympic (Washington), 1938	888,557.79	Finest mountain wilderness of Pacific Northwest
Platt (Oklahoma), 1906	911.97	Cold mineral springs with distinctive properties
Rocky Mountain (Colorado), 1915	255,787.96	Section of the Rocky Mountains; 65 peaks over 10,000 feet
Sequoia (California), 1890	385,258.32	Giant sequoias; Mt. Whitney, highest mountain in U. S. proper
Shenandoah (Virginia), 1935	193,062.74	Tree covered mountains; scenic Skyline Drive
Virgin Islands (U. S. V. Islands), 1956	5,086.41	Beaches, lush hills, historic relics on Island of St. John
Wind Cave (South Dakota), 1903	27,892.66	Limestone caverns in Black Hills; buffalo herd
Yellowstone (Wyoming-Montana-Idaho), 1872	2,213,206.55	World's greatest geyser area; spectacular falls and canyon; one of world's great wildlife sanctuaries
Yosemite (California), 1890	757,990.82	Mountains; inspiring gorges and waterfalls; giant sequoias
Zion (Utah), 1919	128,457.16	Multicolored gorge in heart of southern Utah desert

Art from Egyptian to modern times, in-cluding Far East. Emphasis on painting and sculpture. Classes, lectures, concerts, films. Professional art school.

The Great Seal of the United States

On July 4, 1776, the Continental Congress appointed a committee consisting of Benjamin Franklin, John Adams and Thomas Jefferson "to bring in a device for a seal of the United States of America." After many delays, a verbal description of a design by William Barton was finally approved by Congress on June 20, 1782. The seal shows an American bald eagle with a ribbon in its mouth bearing the

device *E pluribus unum* (One out of many). In its talons are the arrows of war and an olive branch of peace.

"In God We Trust"

"In God We Trust" first appeared on U.S. coins after April 22, 1864, when Congress passed an act authorizing the coinage of a 2-cent piece bearing this motto. Thereafter, Congress extended its use to other coins. On July 30, 1956, it became the national motto.

THE RISE OF THE UNITED STATES

by ARTHUR M. SCHLESINGER, SR.

Emeritus Professor of History, Harvard University

1. Under the English Flag

The land now comprehended within the United States once belonged to Spain, France, England, Holland and Sweden. Spain, colonizing from Mexico in the sixteenth and seventeenth centuries, expanded over most of the Gulf Coast, Texas and the border zone westward through California. France, moving down from Canada in the eighteenth century, annexed the Mississippi Valley from the Apalachians to the Rockies. Meanwhile, in the seventeenth century, the English began peopling the Atlantic shore, and finding the Dutch already established in the present New York and the Swedes in Delaware, seized their possessions.

Notwithstanding this varied international background, United States history has been largely the product of influences emanating from the seaboard communities. Unlike the Spanish and French, the English regarded their colonies as genuine extensions of the homeland, and the settlers sowed English customs, institutions and speech so thoroughly that they eventually spread everywhere. True, the transplanted ways underwent modification, but this arose from necessities imposed by a wilderness existence and, as time went on, from a growing sense of self-sufficiency.

Organized settlement began in 1607 at Jamestown, where the first representative assembly was set up in 1619. The Pilgrims followed at Plymouth in 1620, spearheading a much larger migration of Puritans into New England. Later in the century the Quakers occupied a midway region owned by William Penn, making Philadelphia their headquarters and fanning out in every direction. By 1700 all the thirteen colonies existed but the southernmost, Georgia, which came into being in 1733. The settlers crossed the ocean to escape economic, religious and political oppression and to start anew in a land of greater opportunity.

In time, other strains reinforced the original English population: French Huguenots, Scotch Irish, Germans and minor groups, including the Dutch and Swedes already on hand. African slaves, first introduced at Jamestown in 1619, were welcomed in all the colonies, though the economic need for them was greater in the South, and the system took deeper root there than elsewhere. The people in the North engaged mainly in small farming, fishing and commerce, the Southerners largely in plantation production. Everywhere the colonists practiced self-government. When they clashed with the English-appointed governors, the colonists usually

won out by withholding appropriations.

As the population penetrated farther inland, the settlers encountered the French guarding Canada and the eastern fringes of the Mississippi Valley. In a succession of wars (1689-1763), paralleling greater struggles between the parent nations abroad, France was finally ejected from North America and Britain's dominion extended to the Mississippi. Spain fell heir to the country west of the river, though some years later Napoleon was temporarily to reclaim it for France.

2. Birth of the Nation

With the removal of the Gallic menace the colonists felt less dependent upon the mother country militarily, and England's change from her former policy of "salutary neglect" aroused active resentment. A series of revenue measures, starting with the Sugar Act of 1764, provoked meetings of protest, nonimportation pacts and mob demonstrations in America. Colonial home rule was at stake, also freedom of trade, and the provincials appealed to the principle: "No taxation without representation." Parliament's action in 1774 penalizing all Massachusetts for the deed of a few in dumping dutied tea into Boston Harbor led to the first armed clash at Concord and Lexington on April 19, 1775; but a year and more passed before the patriots resolved upon the hazardous step of independence. The famous Declaration of July 4, 1776, penned by Thomas Jefferson for the Second Continental Congress, justified revolution as the only means to guarantee the "unalienable Rights" of "Life, Liberty and the pursuit of Happiness." Under George Washington as commander in chief the fighting shifted from New England into the middle states and then into the south. General Gates's victory at Saratoga on October 17, 1777, brought England's ancient enemy, France, into the war; just four years later the British yielded to the Allies at Yorktown. The Peace Treaty in 1783 recognized the United States as stretching to the Mississippi.

The infant, though born and baptized, had yet to be weaned. The league of states, formed under the Articles of Confederation in 1781, proved too weak either to deal effectively with foreign countries, or to raise necessary funds, or to ensure unrestricted domestic trade. Within the states, however, Revolutionary idealism prompted action to forbid primogeniture and tax-supported religions, and the Northern commonwealths abolished slavery, a prohibition which Congress's Ordinance of 1787 extended to the territory north of the Ohio. Feebleness of government, combined

with social disturbances culminating in Shays's Rebellion in Massachusetts, made sober men tremble for the sanctity of property rights and seemed to cloud the nation's future. The Federal Convention, summoned in 1787, designed a new framework after much wrangling between rival interests and sections.

The Constitution established a government of three separate and co-ordinate departments—legislative, executive and judicial—each endowed with adequate power, and each to serve as a check and balance on the others. Within its own sphere the general government was supreme, and it exerted its will not through state officials, as under the Articles of Confederation, but immediately upon individuals. Direct popular representation was limited to the House of Representatives, the Senate being chosen by the legislatures (a system which lasted till 1913), the President designated by Electors (who in practice, however, quickly lost their deliberative function), and the Supreme Court appointed by the President and Senate for life. Opposed in many states because of its centralizing and undemocratic features, the Constitution eventually won adoption on the assurance that a bill of rights would be added to preclude federal interference with civil liberties such as freedom of speech, the press and religion. The first ten amendments, in 1791, fulfilled the promise.

Perhaps no convention would have ratified the Constitution if it had been realized that an indivisible Union would ensue. The framers, engaged in the practical task of curing the defects of the Confederation government, strewed phrases through the document that had contradictory implications. On the basis of the text it was possible for equally honest men to maintain that the states were more powerful than the nation, or that the nation overtopped the states. At one time or other nearly every legislature, given what it considered sufficient provocation, asserted the right of nullification or secession. Short of such extreme doctrines, controversy began almost immediately over the question of whether the Constitution should be construed broadly to enhance the national authority or narrowly to lessen it.

Under George Washington, President from 1789 to 1797, the new government became a going concern. Congress, guided by Secretary of the Treasury Alexander Hamilton, buttressed the public credit by arranging to pay at par the national debt and the war-incurred state debts and by creating a United States Bank modeled upon the Bank of England. These measures, especially the last, alarmed Jefferson, veteran liberal and Washington's Secretary of State. Fearing that the legislation would build up a dangerous moneyed class, he urged a strict interpretation of the Con-

stitution in opposition to Hamilton's loose-construction views. The French Revolution widened the breach, for the Jeffersonian Democrats applauded as an upsurge of liberty what the Federalists dreaded as an eruption of chaos. But both men, knowing America's defenseless state, backed Washington's decision to maintain neutrality in France's war with England. Returned to power under John Adams, the Federalists in 1798, however, declared naval hostilities against France and passed the Alien and Sedition Acts to muzzle opposition criticism. Though Adams, defying his party, prevented a full-scale war, he lost the election of 1800 to Jefferson. The Federalists never saw office again.

3. Democracy and Nationalism

The farming interest, which Jefferson deemed the bulwark of free government, had steadily increased since the Revolution. As settlers trekked inland, new states joined the original thirteen: Vermont, Kentucky and Tennessee in the 1790's, with Ohio and others shortly to follow. Western pioneer life begot an intense individualism, fostered political and economic democracy, stimulated nationalism. In the South, by contrast, Eli Whitney's invention of the cotton gin in 1793 opened the way for plantation agriculture and Negro slavery to expand westward beyond the Mississippi. The growth of manufacturing in the Northeast introduced a third element into the scene. The rivalries of these sectional forces wove the principal strands of American history until the Civil War. Toward the mid-century the situation was further confused by the spread of manhood suffrage and a sudden mass immigration from Ireland and Germany.

Jefferson inaugurated the "Virginia Dynasty," his eight years giving way to two terms each of James Madison and James Monroe. He performed his greatest service by purchasing Louisiana from Napoleon in 1803, an act which, though violating his constitutional scruples, carried the flag to the Rockies and vastly enlarged the agricultural domain. With France and England again locked in conflict, depredations on American commerce gave constant provocation to war, but the peace-loving Jefferson applied economic sanctions in the form of an embargo keeping merchantmen at home. Such measures failed, however, and under Madison in 1812 Congress, goaded by the Warhawks, mostly Westerners, declared war on England. Unlike France, she had compounded her offenses by impressing American sailors and, moreover, lay exposed to land attack in Canada. But the assaults on Canada miscarried, and Britain's attempts at counter-invasion with veterans freed by Napoleon's defeat in 1814 fared little better. Unhappily, An-

drew Jackson's victory at New Orleans on January 8, 1815, occurred two weeks too late to affect the Peace Treaty of Ghent, which settled none of the prewar disputes.

Nevertheless the war experience greatly accelerated American nationalism. In 1816 Congress enacted the first protective tariff and chartered a new United States Bank on the model of Hamilton's. In 1819 the country acquired the Gulf region from Spain, who chose to sell rather than have it seized. In 1823 the President, prompted by successful revolutions in Latin America, proclaimed the Monroe Doctrine, warning Europe to keep hands off this new area of freedom.

Other events, however, prefigured growing sectional discord. Opposition to admitting Missouri as a slave state was ended in 1820 only by Congress's agreeing that the rest of the Louisiana Purchase north of the parallel marking her southern boundary should be free soil. Successive tariffs alienated Southerners as class legislation discriminating against their welfare. Touted by the astute South Carolinian, John C. Calhoun, they refurbished the doctrine of state rights as defensive armor. John Quincy Adams's administration (1825-1829) did nothing to improve conditions, and the advent of his successor, Jackson, precipitated a crisis.

Old Hickory, as indomitable in peace as in war, acted boldly against divisive tendencies, whether from the slavocracy or the money power. When South Carolina nullified the Tariff of 1832, he prepared for military action, whereupon the state accepted Congress's olive branch of a lower scale of duties. He smote financial privilege by destroying the Second United States Bank, which wielded monopolistic control over the nation's credit facilities. After eight years Jackson's lieutenant, Martin Van Buren, took over, but a business depression following the Panic of 1837 so discredited his administration that in 1840 the Whigs uproariously elected William Henry Harrison in the famous log-cabin campaign. He died after a month in office, however, and the Whigs fared hardly better with his unintended successor, John Tyler, whose strict-constructionist predictions foiled their plan to establish a third national bank.

Within the free states these years witnessed a ceaseless ferment of humanitarian agitation: crusades for public education, temperance, prison reform, labor's rights, women's rights. Humane people, viewing slavery as an anachronism and a sin, formed organizations to urge its abolition. The moderate-minded, content with demanding its exclusion from the territories, founded a series of unsuccessful parties, beginning with the election of 1840. The

South, frightened by these threats to its cherished institution, found little good in any of the movements and regarded the restless North with mounting apprehension.

4. Sectional Conflict

Western expansionist zeal plus the Southern desire for more slave territory elected James K. Polk over his Whig rival, Henry Clay, in 1844. When the outgoing Congress executed the Democratic pledge to annex Texas, Polk proceeded to high-pressure England into partitioning the jointly held Oregon country at the forty-ninth parallel, and in 1846, while that was still under way, contrived a war with Mexico to acquire California and the territory eastward to Texas. American forces quickly overran northern Mexico and California, but a fiercely contested march from Veracruz through the mountains to Mexico City proved necessary before Polk achieved his goal in the Treaty of Guadalupe Hidalgo early in 1848.

The conquests approximately completed the present continental boundaries. The immediate effect, however, was to arouse sectional dissension over the question of slavery in the new Southwest. Zachary Taylor, elected by the Whigs in 1848, died in office after sixteen months, leaving the crisis in the lap of Millard Fillmore. The Compromise of 1850, piloted through Congress by Henry Clay, admitted California as a free state, left slavery in Utah and New Mexico territories to future judicial determination, and disposed of other disputes. But the settlement soon turned into unsettlement, for Fillmore's Democratic successors, Franklin Pierce and James Buchanan, supported pro-Southern policies.

The Kansas-Nebraska Act of 1854, authorizing slavery by "popular sovereignty" in the country just west of Missouri and Iowa, outraged Northerners as a base repudiation of the historic Missouri Compromise. Guerrilla warfare followed in Kansas, while in the free states the old-time antislavery elements joined with dissident Whigs and Democrats to organize the Republican party. The Republicans insisted that slavery be kept out of all federal territories. Angry contests on the floors of Congress operated like a war of nerves, convincing each side that the other was plotting its ruin. John Brown's insane attempt in 1859 to incite a servile insurrection merely poured oil on the flames. When the Republicans in 1860 elected Abraham Lincoln over a divided Democratic opposition, eleven slave states, appealing to state-rights principles, seceded and established the Confederate States of America.

For the hostilities that ensued, the North possessed the long-run advantage

of superior economic resources and man power, but before these could come into play, the South hoped to win by military prowess and perhaps by the intervention of England, which needed Southern cotton. England, however, never went quite so far, and the Southern authorities failed also to reckon with the inspired leadership of President Lincoln, who taught his people that the preservation of the Union involved not only their country's future but the democratic hope everywhere. While the North went about establishing a blockade by sea, the Confederates under Robert E. Lee brilliantly repulsed repeated land attacks on their capital, Richmond, and countered with battles on Northern soil at Antietam in 1862 and Gettysburg in 1863. But in the west they steadily lost ground until the Union forces late in 1864 swept around the southern tip of the mountains into Lee's rear and, by a pincers movement with Ulysses S. Grant before Richmond, brought final defeat the following April. As soon as military fortunes favored, Lincoln under his war powers proclaimed the emancipation of slaves in all unconquered states and districts, and the Thirteenth Amendment in 1865 universalized the decree. America at long last had caught up with the preamble of the Declaration of Independence.

Even prior to his re-election in 1864, Lincoln "with malice toward none" announced a plan to ease the return of the Southern states to their former place in the Union; but before much could be accomplished, his assassination in April, 1865, brought into office Andrew Johnson, who shared his views of reconstruction without his gifts of persuasion. Over Johnson's vetoes the radical Republicans adopted a punitive program. They imposed military rule upon the South, impeached and almost ousted the President, and exacted ratification of the Fourteenth and Fifteenth Amendments before readmitting the last states in 1870. These amendments were designed to make the freedman a full-fledged citizen and voter. Even so, federal bayonets kept Northern-controlled carpet-bag governments in power for several years more.

5. Business and Government

Already the Republicans were changing from a humanitarian party to one of conservative business. The war gave an immense stimulus to economic life, speeding the construction of railways, the exploitation of minerals and other resources, the development of large-scale manufacturing, the accumulation of wealth, and bringing to the fore great captains of industry and finance, who naturally turned for favors to the dominant party. Despite economic depressions after the Panics of 1873 and 1893, this alliance of business and politics

governed the country almost uninterrupted for the rest of the century, putting successively into office Grant (for eight years), Rutherford B. Hayes, James A. Garfield, Chester A. Arthur (for Garfield's unexpired term), Benjamin Harrison and William McKinley (for two terms).

In the Hayes-Tilden election of 1876, however, the Republicans nearly came to grief, partly because of revelations of widespread graft in Grant's second administration, and partly because of disputed electoral returns from the surviving carpetbag states. A special commission, created by Congress, decided for Hayes by a strictly partisan vote. The Democrats actually won eight years later, the voters preferring Grover Cleveland to James G. Blaine, whom they suspected of political corruption. Cleveland, though defeated in 1888, triumphed again in 1892 largely because the Republicans had claimed too much for the beneficence of tariff protection. The Republicans avoided other disasters by harping upon Democratic disloyalty during the Civil War ("waving the bloody shirt") and by catering to the Northern veterans' vote with generous pensions.

Conservative Republicanism met its principal difficulties in Congress, where the Western members, supported usually by Southern Democrats, uneasily resisted capitalistic domination. The Farther West, peopling rapidly after the war, gave a fresh dimension to the nation. Thanks to the attractions of precious minerals, cattle raising and free homesteads, this last frontier yielded steadily to settled communities, and between 1876 and 1896 eight additional states entered the Union. A new sectionalism emerged in politics, for Western needs and aspirations differed at many points from those of the East. The wage earners, too, feared the growing power of Big Business, but despite mounting numbers they lacked political representation and hence concentrated on trade-union methods, forming the American Federation of Labor in 1881. The two depression periods produced violent strikes and upheavals. Labor, however, prevailed upon Congress to place restraints on immigration in order to discourage competition by underpaid workers, especially from Southern and Eastern Europe.

Legislative struggles nearly always pivoted on issues affecting the new industrial order. The problem of greenback inflation, arising from the war, was finally settled to Eastern satisfaction by the Resumption Act of 1875. The drive for higher and yet higher protection succeeded with occasional reverses until the Dingley Tariff in 1897 set a record. Congress under Western pressure took ineffective steps in 1887 and 1890 to regulate railways and business combinations, and it made some early concessions also to the Western de-

mand for free silver. During the Panic of 1893, however, Cleveland induced Congress to stop the inflation; and after the silverites, capturing the Democratic convention in 1896, failed to elect their nominee, William Jennings Bryan, the Republicans reduced silver to a minor coin and committed the country to the gold standard.

Foreign relations reflected similar tendencies, for the expanding industrial system demanded new markets, openings for investment and sources of raw materials. Cleveland withstood imperialistic sentiment, and in 1898 the McKinley administration intervened in the Cuban insurrection under the whip of popular anger at Spanish methods of repression and the explosion of the battleship *Maine* in Havana Harbor. Spain was quickly routed not only in the West Indies but also in her possessions off Asia. Though the "splendid little war" was prompted less by Wall Street than by a superheated sensational press, it bore fruit in the annexation of Puerto Rico, the Philippines and Guam, and brought businessmen further advantages through the quasi protectorate imposed on Cuba (later extended to other Caribbean countries). About the same time Hawaii and American Samoa were acquired, and Secretary of State John Hay's "open door" policy promised a growing trade with China. Theodore Roosevelt, raised to the presidency by McKinley's assassination in September, 1901, further advanced the cause by abetting a revolution against Colombia, thereby assuring the construction of the Panama Canal and much shorter distances within the colonial empire.

In domestic politics, however, Roosevelt aligned himself with the rising sentiment against business-dominated government, preaching with gusto the doctrine of the "square deal," and in his seven years breaking ground for later and more substantial advances. Despite party reactionaries he put teeth into the enforcement of the Antitrust Act of 1890, bullied Congress into tightening control over railroads and industrial monopolies, and initiated measures for conserving the nation's natural resources. William Howard Taft, his choice as successor, quietly pursued similar policies; but Taft's endorsement of the steep Payne-Aldrich Tariff together with other missteps so embittered the reformers that, failing to prevent his renomination in 1912, they organized the Progressive party to run their idol "Teddy" again. The Democrats, facing a divided opposition, elected their candidate, Woodrow Wilson.

Superbly endowed intellectually, and gifted with Jefferson's power to express democratic aspirations, Wilson proceeded with magisterial authority to climax the earlier efforts at reform. The Underwood Tariff enacted the lowest rates since the

Civil War; the Federal Reserve Act superseded an outworn national banking system; and the Clayton Act created the Federal Trade Commission to stop "unfair methods of competition." Two other measures, launched by popular demand during World War I, involved changes in the Constitution. The Eighteenth Amendment in 1920 enacted national prohibition, which ran its stormy course in thirteen years and required the Twenty-first for its undoing. The Nineteenth Amendment (1920) extended to all women the suffrage which in some states they already possessed.

6. World War and After

With America a neutral in 1914 when the European struggle began, the administration's chief energies turned to the protection of maritime rights. Wilson and his countrymen, hating war and traditionally isolationist, only gradually perceived the threat to national security if a militaristic Germany should supplant Britain as mistress of the Atlantic; but Berlin's revival of ruthless submarine operations a few months after Wilson's second election clarified men's minds. Congress, stirred by his appeal that "The world must be made safe for democracy," declared war on April 6, 1917. The government, racing against time, swiftly put the nation on a battle footing, enacting universal conscription, taking over the railways, and regimenting industry, labor and agriculture. It was the country's introduction to total war. In the summer of 1918 Yankee troops under General John J. Pershing helped repulse a great German drive on the Marne and in September shared in the mighty Meuse-Argonne counteroffensive, which ended the struggle on November 11.

At the Paris Peace Conference, Wilson fought stubbornly for the democratic settlement he had earlier outlined under Fourteen Points, but gained principally his proposal of a League of Nations, which he saw as a sort of continuing peace conference. At home the Republican-controlled Senate, whipping up isolationist sentiment, completed his rout, for when Wilson spurned efforts to amend the treaty, that body under the two-thirds requirement rejected it by a minority vote. The tide was turning from wartime idealism to what Warren G. Harding, overwhelmingly elected by the Republicans in 1920, called "normalcy." Disclosures of corruption in high government circles hastened Harding's death, elevating Calvin Coolidge, who renewed his presidency by election a year later and was followed in 1929 by Herbert Hoover. All three, while keeping out of the League, nevertheless co-operated with some of its minor activities and, on their own, concluded a number of collective treaties for temporary naval disarmament and the outlawry of war.

These part-way steps were offset, however, by an upsurge of economic nationalism: a skyward trend of protective duties, a relaxing of controls over giant corporations, and a quota limitation on European immigration. "Rugged individualism" produced the dizziest prosperity the country had ever known, only to collapse in 1929 into the worst depression ever known. Hoover, striving vainly to repair the damage, met abject defeat in 1932 at the hands of the socially minded Franklin D. Roosevelt, who pledged a "new deal" by the Democrats. Under Roosevelt's thrilling leadership Congress, casting precedent to the winds, voted billions for relief, "primed the pump" of business and agriculture to hasten recovery, and inaugurated long-range reforms to increase foreign trade through reciprocal tariff reductions, reorganize banking practices, safeguard trade-union activities, guarantee minimum wages, destroy electrical holding companies, and provide for social insurance and a government-planned development of the Tennessee Valley.

7. World War Again

Toward Latin America Franklin Roosevelt adopted the "good neighbor" policy, relinquishing the Caribbean protectorates and transforming the Monroe Doctrine into a mutual nonaggression pact. As further evidence of the retreat from imperialism, Congress made provision for Philippine freedom in 1946. Relations with other parts of the world, however, posed increasing problems. As the Axis dictators and their Oriental partner, Japan, began overrunning weaker peoples, Congress under isolationist influences directed Roosevelt, against his wish, to embargo munition sales to both victim and assallant; but public opinion forced a lifting of the ban after England and France in September, 1939, took up arms against Nazi aggression. Hitler's subjugation of France the following June emboldened Roosevelt to more active steps, for crippled England now alone defended the Atlantic from totalitarian domination. Congress at his behest voted vast sums for rearmament and adopted peacetime conscription, and Roosevelt, without consulting Congress, gave England fifty destroyers in exchange for a string of naval bases located off North America.

Isolationists, mostly Republicans, denounced Roosevelt's "warmongering," while he, still clinging to measures "short of war," stressed insistently the gathering dangers to the American way of life—to freedom of speech, freedom of worship, freedom from want and freedom from fear. The people responded by choosing Roosevelt in 1940 as their first third-term President. In March 1941, he secured adoption of the lend-lease plan and soon began

using the navy to safeguard the supplies en route.

Before a crisis was reached, the Japanese war lords, irked by America's stiffening attitude toward their own conquests and gambling upon an Axis victory in Europe, treacherously attacked Pearl Harbor on December 7, clearing the way for the seizure of Guam, the Philippines and two of the Aleutians, as well as many Dutch and British holdings. Within four days Germany and Italy declared war against the United States.

America quickly girded herself for the mightiest struggle in history. Enlarging upon Wilson's wartime methods, the government completely reorganized the national economy for an unparalleled output of arms and food. By summer, sea, land and air forces were attacking the enemy all over the globe. In May 1943, after bitter fighting, Anglo-American armies expelled the Axis from North Africa, then invaded southern Italy and forced the government's submission in September, though the Nazis there kept up the fight. Landing in Normandy in June 1944, the Allies under Dwight D. Eisenhower's supreme command battered their way through France and across the Rhine, while the Russians pounded the Nazis from the east. On May 7, 1945, Germany unconditionally surrendered. The Pacific war was no less desperately contested; but the Allies, based on Australia, slowly won control of the sea and, pressing onward from island to island, hastened Japan's unconditional surrender on August 14, 1945, by loosing the atomic bomb and by Soviet Russia's last-minute entry into the conflict.

World War II was at an end, but what would be the nature of the peace? The Atlantic Charter, signed in August, 1941, by Roosevelt and Churchill and later agreed to by all the Allies, pledged them against "aggrandizement, territorial or other," but subsequent conferences by the major powers—at Cairo, Teheran, Yalta, Potsdam and elsewhere—foreshadowed a different outcome. Russia in particular demanded substantial territorial advantages. In July 1946, the Allies gathered at Paris to draw up terms for Italy and the Axis satellites: Rumania, Bulgaria, Hungary and Finland. Germany and Japan, which were under armed occupation, were reserved for later handling.

Without waiting for final military victory, fifty countries, at Roosevelt's initiative and with bipartisan support in America, had set up a successor to the League: the United Nations. Roosevelt, elected a fourth time in 1944, died suddenly on April 12, 1945, several weeks too soon to assist in framing the charter at San Francisco.

Years of Decision: 1945-56

by LOUIS M. HACKER

Dean of the School of General Studies and Professor of Economics, Columbia University

1. The Truman Administrations of 1945-53

Truman assumed office on the death of Roosevelt in April 1945. His Fair Deal was a continuation of the New Deal. Part of the program was enacted; part of it failed, notably Truman's request for the repeal of the Taft-Hartley Act of 1947 (which defined unfair trade-union practices). Inflexible price supports for agriculture were established, but agricultural net income from 1951 on declined as a result of contraction in domestic and foreign demand and continuing high productivity.

In foreign affairs, the Administration's program of "containment" resulted in the carrying out of the "Truman Doctrine" (1947) of military and economic aid to Greece and Turkey, then under Soviet pressures; the Marshall Plan (1948) of military and economic assistance to all countries seeking help (such grants and loans came to \$50 billion during 1945-51); and the establishment of the North Atlantic Treaty Organization (1949), largely with American financing. In 1948, the Berlin airlift rescued that city from the Russian blockade; and Administration policy led to the creation of the West German Bonn Government and agreement among the allies to free Bonn from occupation restrictions. In 1949, Truman enunciated his "Point Four" program for technical assistance to economically backward countries.

Korea became the test of Truman foreign policy. In June 1950, North Korean Communist forces crossed the 38° parallel to invade South Korea and, under American leadership, the U.N. Council declared North Korea an aggressor. U.N. forces—largely made up of American troops and headed by Gen. Douglas MacArthur—landed, met initial setbacks, but in September were able to outflank the North Koreans at Inchon and sweep north to the Yalu River (November). At this point, China entered the war (the Administration had been warned this would occur) and from thence on the fortunes of war saw-sawed. In April 1951, MacArthur was relieved (for advocating an attack on Manchuria), and a stalemate set in at the 38° parallel.

2. The Eisenhower Administration 1953-56

Eisenhower accepted the social interests and guarantees of government as regards

the well-being of Americans; to this extent the New Deal was not abandoned. He called for highway construction, slum clearance, expanding social security, and aid for education and medical insurance. But he looked to wider state co-operation in the furtherance of such programs, including power expansion. Like Truman, he was an advocate of civil rights; and the Supreme Court in September 1954 unanimously handed down its celebrated decision for integration of Negroes and whites in the schools of the nation (which the Federal district courts began to enforce).

Eisenhower, however, was committed to economy in government and getting the government out of the economy. Direct controls over prices and wages were removed; efforts were made to assist small business; government activities were curtailed (in power development, control over tidal oil lands); taxes were lightened on individuals and businesses; flexible price supports for agriculture and the establishment of a "soil bank" replaced the rigid price controls; notably monetary and fiscal measures (with the Treasury and the Federal Reserve co-operating) were used in recession (1954) and inflation (1956).

As Americans were taking the initiative of making jobs for one another, per capita disposable income (evidences of mounting prosperity) went up from \$1,547 in 1946 to \$1,629 in 1955 (in dollars of 1955 purchasing power). There were more than 66.8 million in the total civilian labor force at the end of August.

In foreign affairs, the acceptance of the realities of Russian power led to the adoption of the policy of "co-existence." The unhappy war in Korea was ended by a truce in July 1953. Atomic weapons and guided missiles continued to be built, but the plan of "atoms for peace" was launched in 1953; the U. S. talked of disarmament and its willingness to accept international inspection (at Geneva in 1955); it was ready to explore cultural exchanges with Iron Curtain countries. To peace there is "no real alternative," was the Administration's position; it kept its defenses powerful, however, curtailed foreign aid, and relied more upon its own resources and purposes. America kept its allies, but was guided less by their interests and more by its own. International tensions had definitely lessened.

Principal Bills and Treaties Since 1900

PARTY ABBREVIATIONS

Dem.—Democratic
Rep.—RepublicanA.L.—American Labor
F.L.—Farmer-LaborInd.—Independent
Prog.—ProgressiveProh.—Prohibition
Soc.—Socialist

Bill or treaty	Party	House vote		Senate vote		Date enacted
		Yea	Nay	Yea	Nay	
Hay-Pauncefote Treaty. England agreed the U. S. can build and control an Isthmian canal open to all nations on equal terms (ratified Dec. 16, 1901).		No vote required		72	6	Nov. 18, 1901
Hay-Bunau-Varilla Treaty. Granted the U. S. a ten-mile strip in Panama in perpetuity for \$10,000,000 in gold and an annuity of \$250,000.	Dem. Rep.	No vote required		9 41	15 1	Mar. 19, 1903
Pure Food and Drug Act. Made shipments in interstate commerce of adulterated foods and drugs illegal.		240	17	63	4	June 30, 1906
Immigration Act. Barred paupers, anarchists, criminals and diseased persons.						Mar. 26, 1910
Glass-Owen Bill. Established a Federal Reserve system.		298	60	43	25	Dec. 23, 1913
Federal Trade Commission. Established to enforce anti-trust laws.		No roll-call vote		53	16	Sept. 26, 1914
Clayton Antitrust Act. Prohibited monopolistic price discrimination, restrictive sales or leases, intercorporate stock holding, interlocking directorates of competing companies capitalized at \$1,000,000 or more. Exempted labor from antitrust laws and declared peaceful picketing legal.		244	54	35	24	Oct. 15, 1914
Federal Farm Loan Act. Created system of land banks to lend money to farmers on their land and permanent improvements.		No roll-call vote		58	5	July 17, 1916
Keating-Owen Act. Forbade shipping in interstate commerce of goods produced by children. (Declared unconstitutional in 1918.)		337	46	52	12	Sept. 1, 1916
Adamson Act. Limited working hours of railroad employees to 8 per day on interstate railroads.		259	36	43	28	Sept. 3-5, 1916*
Burnett Immigration Bill. Required literacy test for immigrants.		308	87	64	7	Vetoed, Jan. 29, 1917
		285	106	62	19	Feb. 5, 1917
		(Reconsideration vote)				
Armed Neutrality Act. Allowed American vessels to be armed in war zones.		Filibustered		Defeated, Mar. 4, 1917
Declaration of War. Against Germany (World War I).		373	50	82	6	Apr. 6, 1917
National Prohibition Act (Volstead Act). Prohibited manufacture, transportation and sale of beverages containing more than .5 per cent alcohol.		321	70	Voice vote approval		Vetoed, Oct. 27, 1919
		176	55	65	20	Oct. 28, 1919
		(Reconsideration vote)				
Treaty of Versailles.	Dem. Rep.	No vote required		4 35	42 13	Defeated, Nov. 19, 1919
Treaty of Versailles.	Dem. Rep.	No vote required		21 28	23 12	Defeated, Mar. 19, 1920

Public-housing bill. Allowed 35,000 units for year, but limited housing to cities where Federal slum clearance had displaced families.		358	30	59	21	Aug. 2, 1954
Tax revision to cost \$1.363 million in revenue.	Rep. Dem. Ind.	201 114 0	3 73 1	42 19 0	3 22 1	Aug. 16, 1954
Communist Control Act. Outlawed Communist party, though membership in party was not made crime.		265	2	79	0	Aug. 24, 1954
Compromise Mutual Security Appropriation of \$5,243,575,-795, of which \$2,781,499,816 is "new money."		188	77	Voice vote approval		Aug. 26, 1954
Farm bill. Provided flexible price support.		208	47	44	28	Aug. 28, 1954
Amendment to Atomic Energy Act of 1946. Allowed private interests to enter field of atomic power.	Rep. Dem. Ind.	Voice vote approval		6 38 1	35 6 0	Aug. 30, 1954
Social Security benefits increased and extended to additional 10,000,000 persons.		Voice vote approval		Voice vote approval		Sept. 1, 1954
Death penalty for peacetime espionage.		Voice vote approval		Voice vote approval		Sept. 3, 1954
Revocation of citizenship of persons convicted by conspiracy to overthrow government by force.		Voice vote approval		Voice vote approval		Sept. 3, 1954
Federal pay raise bill. Raised salaries of Senate and House members to \$22,500; Vice President and House Speaker to \$45,000; Justices of U. S. Supreme Court to \$35,000; etc.	Dem. Rep.	119 104	53 60	Voice vote approval		Mar. 2, 1955

Bill or treaty	Party	House vote		Senate vote		Date enacted
		Yea	Nay	Yea	Nay	
Military pay raise bill. Provided pay raise for armed services amounting to \$745 million per year.		Voice vote approval		Voice vote approval		Mar. 31, 1955
Postal pay raise bill. Increased pay of postal workers by average of 8.8%.	Dem. Rep.	212 116	0 66	37 29	0 11	Vetoed May 19, 1955
(Defeated in Senate by lack of 2/3 majority vote to override veto.)	Dem. Rep.	(Reconsideration vote)				Defeated May 24, 1955
		46 8	2 37	
Postal pay raise bill. Increased pay of postal workers by average of 8%.		407	1	78	0	June 10, 1955
Selective Service bill. Extended draft 4 years and doctors' draft 2 years.		388	5	Voice vote approval		June 30, 1955
Funds for Dixon-Yates transmission line included in appropriations bill.		Voice vote approval		Voice vote approval		Ordered canceled, July 11, 1955 ²
Military reserves bill. Raised present 800,000-man reserve to 2,900,000 by mid-1959.	Dem. Rep.	169 146	38 40	Voice vote approval		Aug. 9, 1955
Housing bill. Authorized construction of 45,000 public-housing units by mid-1956.	Dem. Rep.	153 35	37 131	Voice vote approval		Aug. 11, 1955
Federal minimum-wage bill. Increased minimum from 75¢ to \$1 per hour.	Dem. Rep.	192 170	29 25	Voice vote approval		Aug. 12, 1955
Harris-Fulbright bill. Would have exempted natural-gas producers from direct Federal rate control.	Dem. Rep.	86 123	136 67	22 31	24 14	Vetoed, Feb. 17, 1956
		(No reconsideration vote)				
Upper Colorado River project bill. Authorized \$756 million for irrigation and reclamation in Upper Colorado River basin.		Voice vote approval		Voice vote approval		Apr. 11, 1956
Agricultural Act of 1956. Would have set up "soil bank" program and would have restored high rigid support prices.	Dem. Rep.	189 48	35 146	35 15	4 31	Vetoed, Apr. 15, 1956
(Defeated in House by lack of 2/3 majority vote to override veto.)	Dem. Rep.	(Reconsideration vote)				Defeated, Apr. 18, 1956
		182 20	38 173	
Compromise farm bill. Authorized \$1.2 billion "soil bank" program for paying farmers to withdraw acres from production.	Dem. Rep.	172 132	12 47	Voice vote approval		May 28, 1956
Highway bill. Called for expenditure of \$33.482 billion for road building (\$28.057 billion Federal expenditure and \$5.425 billion outlay by states).		Voice vote approval		89	1	June 29, 1956
National-defense bill. Appropriated \$34.6 billion for national defense, including \$16.5 billion for Air Force.		377	0	88	0	July 2, 1956
School bill. Would have provided \$1.6 billion in Federal aid for school construction.	Dem. Rep.	119 75	105 119	Defeated, July 5, 1956 ³
Foreign-aid authorization bill. Authorized \$4 billion for foreign-aid program for another year.		No record vote		No record vote		July 18, 1956
Social Security bill. Made women eligible for benefits at 62, totally disabled workers at 50.		Voice vote approval		Voice vote approval		Aug. 1, 1956
Housing bill. Provided for 70,000 new Federally subsidized housing units for next 2 years and liberalized Federal aid to private housing.		Voice vote approval		Voice vote approval		Aug. 7, 1956

¹ Passed with added provisions and sent back to House. ² Dixon-Yates contract ordered canceled by President and funds dropped by Congress from appropriations bill. ³ Bill killed, since all money bills must originate in House.

NOTE: You will find Bills and Treaties of 1957 following *News Record of 1957*. (See Table of Contents for *News Record*.)

How a Bill Becomes a Law

When a Senator or a Representative introduces a bill, he sends it to the clerk of his house, who gives it a number and title. This is the *first reading*, and the bill is referred to the proper committee.

The committee may decide the bill is unwise or unnecessary and *table* it, thus killing it at once. Or it may decide the bill is worthwhile and hold hearings to listen to facts and opinions presented by experts and other interested persons. After members of the committee have debated the bill and perhaps offered amendments, a vote is taken; and if the vote is favorable, the bill is sent back to the floor of the house.

The clerk reads the bill sentence by sentence to the house, and this is known as the *second reading*. Members may then debate the bill and offer amendments. In the House of Representatives, the time for debate is limited by a *cloture rule*, but there is no such restriction in the Senate except by a two-thirds vote for cloture. This makes possible a *filibuster*, in which one or more opponents hold the floor to defeat the bill.

The *third reading* is by title only, and the bill is put to a vote, which may be by voice or roll call, depending on the circumstances and parliamentary rules. Members who must be absent at the time but who wish to record

their vote may be paired if each negative vote has a balancing affirmative one.

The bill then goes to the other house of Congress, where it may be defeated, or passed with or without amendments. If the bill is defeated, it dies. If it is passed with amendments, a joint Congressional committee must be appointed by both houses to iron out the differences.

After its final passage by both houses, the bill is sent to the President. If he approves, he signs it, and the bill becomes a law. However, if he disapproves, he *veto*es the bill by refusing to sign it and sending it back to the house of origin with his reasons for the veto. The objections are read and debated, and a roll-call vote is taken. If the bill receives less than a two-thirds vote, it is defeated and goes no farther. But if it receives a two-thirds vote or greater, it is sent to the other house for a vote. If that house also passes it by a two-thirds vote, the President's veto is *overridden*, and the bill becomes a law.

Should the President desire neither to sign nor to veto the bill, he may retain it for ten days, Sundays excepted, after which time it automatically becomes a law without signature. However, if Congress has adjourned within those ten days, the bill is automatically killed, that process of indirect rejection being known as a *pocket veto*.

Assassinations and Attempts in U. S. Since 1865

CERMAK, Anton J. (Mayor of Chicago): Shot Feb. 15, 1933, in Miami by Giuseppe Zangara, who attempted to assassinate Franklin D. Roosevelt; Cermak died Mar. 6.

GARFIELD, James A. (President of U. S.): Shot July 2, 1881, in Washington, D. C., by Charles J. Guiteau; died Sept. 19.

LINCOLN, Abraham (President of U. S.): Shot Apr. 14, 1865, in Washington, D. C., by John Wilkes Booth; died Apr. 15.

LONG, Huey P. (U. S. Senator from Louisiana): Shot Sept. 8, 1935, in Baton Rouge by Dr. Carl A. Weiss; died Sept. 10.

McKINLEY, William (President of U. S.): Shot Sept. 6, 1901, in Buffalo by Leon Czolgosz; died Sept. 14.

ROOSEVELT, Franklin D. (President-elect of U. S.): Escaped assassination unhurt Feb. 15, 1933, in Miami. See Cermak.

ROOSEVELT, Theodore (ex-President of U. S.): Escaped assassination (though shot) Oct. 14, 1912, in Milwaukee while campaigning for President.

SEWARD, William H. (Secretary of State): Escaped assassination (though injured) Apr. 14, 1865, in Washington, D. C., by Lewis Powell (or Paine), accomplice of John Wilkes Booth.

TRUMAN, Harry S. (President of U. S.): Escaped assassination unhurt Nov. 1, 1950, in Washington, D. C., as 2 Puerto Rican nationalists attempted to shoot their way into Blair House.

The Liberty Bell

The Liberty Bell was cast in England in 1752 for the Pennsylvania Statehouse (now Independence Hall). Damaged in transit, it was recast in Philadelphia in 1753. It is inscribed with the words, "Proclaim liberty throughout all the land unto all the inhabitants thereof" (Lev. 25:10). The bell was rung on July 8, 1776, for the first pub-

lic reading of the Declaration of Independence. Hidden in Allentown during the British occupation of Philadelphia, it was replaced in Independence Hall in 1778 where it remains today. The bell cracked on July 8, 1835, while tolling the death of Chief Justice John Marshall.

THE UNITED STATES ARMED SERVICES

U. S. MILITARY ACADEMY

Source: U. S. Military Academy.

Established in 1802 by an Act of Congress, the U. S. Military Academy is located on the west bank of the Hudson River some 50 miles north of New York City. Admission may be gained only by appointment to one of the 2,496 cadetships authorized by law. These cadetships are allocated among the following sources of nomination:

Noncompetitive:

Representatives (4 each)	1,740
Senators (4 each)	384
Other:	
Hawaii and Alaska	8
District of Columbia,	6
Canal Zone Government ...	2
Puerto Rico	4
Vice Presidential	3
	23

Competitive:

Army and Air Force:	
Regular components	90
Reserve components	90
Presidential	89
Sons of deceased veterans	40
Honor military & honor naval schools	40
Total	2,496

Graduation of the senior class leaves about 750 vacant cadetships each year, and candidates may be nominated for these vacancies during the year preceding the admission date—the first Tuesday in July.

Candidates must be citizens of the U. S., between the ages of 17 and 22, unmarried, high school graduates and able to meet the mental, medical and physical aptitude requirements. Candidates with acceptable college records may qualify mentally by satisfactory performance on the College Entrance Examination Board's Scholastic Aptitude Test; all other candidates take the CEEB's Scholastic Aptitude Test and achievement tests in intermediate mathematics and English composition. Entrance requirements and procedures for appointment are described in the U. S. Military Academy Catalog, available without charge from The Registrar, U. S. Military Academy, West Point, N. Y.

Cadets receive their entire education at Government expense and are paid \$111.15 per month. From this sum, they pay for their uniforms, textbooks, etc. Upon successful completion of the 4-year course, the graduate receives the degree of Bachelor of Science and is commissioned a second lieutenant in the regular Army or Air Force.

U. S. NAVAL ACADEMY

Source: U. S. Naval Academy.

On October 10, 1845, the Naval School was established at Fort Severn, Annapolis, Maryland. Five years later it was renamed the United States Naval Academy, and the following year a regular four-year course was adopted. At present, the curriculum consists of courses in the following departments: executive; seamanship and navigation; ordnance and gunnery; marine engineering; aviation; electrical engineering; mathematics; English, history and government; foreign languages; hygiene; and physical education.

Candidates are selected as follows:

- 5 from the District of Columbia.
- 40 sons of men and women killed in action or who have died, or may hereafter die of wounds or injuries, or disease contracted, in active service in World Wars I and II and other periods.
- 75 annually from among sons of officers and enlisted men in the regular Army, Navy, Marine Corps, Air Force and Coast Guard.
- 160 enlisted Navy and Marine personnel selected annually by competitive examination.
- 160 annually chosen by the Secretary of the Navy from the Naval and Marine Corps Reserves.
- 5 Puerto Ricans chosen by the Resident Commissioner of Puerto Rico.
- 1 on the recommendation of the Governor of Puerto Rico.
- 4 Filipinos designated by the President of the United States.
- 1 from the Canal Zone.
- 20 annually from schools designated by the Army and Navy as honor schools and from NROTC schools.
- 20 from the American republics and the Dominion of Canada.

Unlimited: Sons of persons who have been or shall hereafter be awarded the Congressional Medal of Honor.

Each Senator, Representative, delegate to Congress, and the Vice President may have not more than 5 Midshipmen at the Naval Academy. The Board of Commissioners selects the 5 from the District of Columbia. The President selects the 40 sons of deceased veterans of World Wars and the 75 sons of officers and enlisted men in the regular Army, Navy, Marine Corps, Air Force and Coast Guard. The President also appoints the sons of holders of the Medal of Honor.

Subject to the existence of vacancies and the availability of accommodations, the Secretary of the Navy may nominate for appointment a limited number of additional candidates. These must be recom-

mended by the Academic Board from among the fully qualified, regularly nominated alternate and competitive candidates of the same year who were unable to enter because of the appointment of men preceding them in nomination.

Candidates for admission must be between 17 and 22 years of age on July 1 of their entering year. They may qualify by taking entrance examinations, by presenting an acceptable secondary school certificate and taking special examinations in English and mathematics, or by completing a sufficient number of acceptable college courses. Candidates must meet physical requirements and be unmarried.

Midshipmen are paid \$111.15 per month. Graduates of the Academy are granted Bachelor of Science degrees and are commissioned as ensigns in the Navy or second lieutenants in the Marine Corps. In addition, a limited number of the members of graduating classes may be commissioned in the U. S. Air Force.

U. S. COAST GUARD ACADEMY

Source: U. S. Coast Guard Academy.

The cadet system of the Coast Guard was established by law on July 31, 1876, when the "School of Instruction" for the Revenue Cutter Service, predecessor to the Coast Guard, was authorized.

The *J. C. Dobbin*, a converted schooner, served as the first schoolship, and was succeeded in 1878 by the bark *Chase*, a ship built for cadet training. First winter quarters were in a sail loft at New Bedford, Mass. The school was moved in 1900 to a two-story frame school at Curtis Bay, Md., to provide a more technical education; and in 1910 to Fort Trumbull, New London, Conn. In 1932 the Academy moved to its present site in the latter city.

The 4-year college-level curriculum leads to a Bachelor of Science degree and to a commission of ensign in the U. S. Coast Guard.

Cadets receive appointment to the Academy through a nation-wide competitive examination, held annually in February. Candidates must be between 17 and 22 years of age, physically sound, unmarried and at least 5' 6" tall. They must agree to remain unmarried until graduation and to serve at least 4 years on active duty. Cadets receive \$111.15 per month to cover their uniform and incidental expenses, and are furnished their rations and quarters. Applications for appointment may be made to the Commandant (PTP), U. S. Coast Guard, Washington 25, D. C.

U. S. MERCHANT MARINE ACADEMY

Source: U. S. Merchant Marine Academy.

The U. S. Merchant Marine Cadet Corps was established Mar. 15, 1938, and its Academy is located on the south shore of

Long Island Sound at Kings Point, N. Y. The Academy has a complement of 800 cadet-midshipmen representing every U. S. state, D. C., Alaska, the Canal Zone, Hawaii, and Puerto Rico. In addition, it is authorized to receive each year, for the full period of training, not more than 12 candidates from Latin American republics.

Appointments to the Academy are governed by a state and territory quota system, based on population, and are made through competitive examinations. A candidate must be an unmarried citizen between 17 and 21, with a one-year age waiver granted to veterans. He must have 15 high-school credits, including 1 unit in algebra, 1 in plane geometry, 1 in physics, and 3 in English.

The course is 4 years, consisting of 1 year as Fourth Classman at the Academy, 1 year as Third Classman aboard a merchant ship, and 2 years as Second and First Classman at the Academy. Study includes marine engineering, navigation, electricity, ship construction, naval science and tactics, economics, business, languages, history, and other subjects.

On completion of their courses, cadet-midshipmen are examined for their original Merchant Marine license as deck or engineer officers in any ship in the U. S. Merchant Marine. They also receive Bachelor of Science degrees and commissions as officers in the U. S. Naval Reserve. Over 9,000 officers have been graduated.

U. S. AIR FORCE ACADEMY

Source: U. S. Air Force Academy.

The bill establishing the Air Force Academy was signed by President Eisenhower on Apr. 1, 1954. The first class of 306 cadets was sworn in on July 11, 1955, at Lowry Air Force Base, Denver, Colo., the Academy's temporary location. Permanent headquarters, at Colorado Springs, Colo., are expected to be completed in 1958.

Eventually the Academy will have a complement of 2,496. Qualified sons of Medal of Honor winners will be admitted in addition to the number of vacancies.

Candidates must be citizens of the U. S., at least 17 but less than 22 on July 1 of the year for which they seek admission, unmarried, at least 5' 4" and not more than 6' 4" tall and able to meet the mental and physical requirements. A candidate is required to take the following examinations and tests: (1) The Air Force Medical Examination for Flying Training; (2) The Air Force Pilot Aptitude and Observer Aptitude Tests; (3) The College Entrance Examination Board Tests; and (4) a physical aptitude examination.

Cadets receive their entire education at Government expense and, in addition, are paid \$111.15 per month. From this sum, they pay for their uniforms, textbooks,

etc. Upon completion of the 4-year course, leading to a bachelor's degree, a cadet who meets the physical qualifications is ap-

pointed a second lieutenant in the regular U. S. Air Force as a navigator, then receives full pilot training.

History of the Armed Services

Source: U. S. Department of Defense.

U. S. ARMY

When Gen. Washington, on July 3, 1775, took command of the colonial militia (about 8,000 men) besieging Boston, the event marked the union of the forces of the 13 separate colonies under one head, and the U. S. Army was born. In Jan. 1776, the Continental Congress decided that these troops should be separate in organization from those of local communities and established them as the U. S. Regular Army. When these forces were disbanded after the war, only some 80 officers and men were retained to guard U. S. Army stores. From this humble beginning, in the ensuing years, the strength of the U. S. Army rose or fell according to national and international conditions.

U. S. NAVY

In Sept. and Oct. 1775, Gen. Washington maintained 5 schooners and a sloop with officers and men from his army for the purpose of preying on inbound English supply vessels and thereby caused the birth of the U. S. Navy. In Dec. 1775, the Continental Congress expanded this by providing for construction of naval craft and the appointment of a marine committee (one member from each colony) which continued until 1794 when further ships and manpower were provided for by act of Congress. Upon completion of these ships in 1798, a Navy Department was established as the controlling agency, and the secretary given Cabinet rank.

U. S. AIR FORCE

Until creation of the National Military Establishment in September 1947, which united the services under one department, military aviation was a part of the U. S. Army. In the Army, aeronautical operations came under the Signal Corps from 1907 to 1918, when the U. S. Air Service was established. In 1926, the U. S. Air Corps came into being and remained until 1942, when the Army Air Forces succeeded it as the Army's air arm.

In the Navy, ship-based fighters and bombers are attached to the several fleets and are under the orders of the fleet commanders. Marine Corps aviation comes under control of the Navy.

In 1947, the U. S. Air Force was established as an independent military service under the National Military Establishment. At that time, the name U. S. Air Corps and the names of the services within the Army Air Forces were abolished.

U. S. COAST GUARD

Our country's oldest continuous seagoing service, the U. S. Coast Guard traces its history back to 1790 when the First Congress authorized the construction of ten vessels for the collection of revenue. Known first as the Revenue Marine, and later as the Revenue Cutter Service, the Coast Guard received its present name in 1915 under an act of Congress combining the Revenue Cutter Service with the Life-Saving Service. In 1939, the Lighthouse Service of the Department of Commerce was also consolidated with this unit. The Bureau of Marine Inspection and Navigation was transferred temporarily to the Coast Guard in 1942, permanently in 1946. Through its antecedents, the Coast Guard is one of the oldest organizations under the Federal government and, until the Navy Department was established in 1798, served as the only U. S. armed force afloat. In time of peace it operates under the Treasury Department, serving as the Nation's primary agency for promoting marine safety and enforcing Federal maritime laws. In time of war, or on direction of the President, it is attached to the Navy Department.

U. S. MARINE CORPS

Founded in 1775 and observing its official birthday on Nov. 10, the U. S. Marine Corps was developed to be able to serve to advantage on land or sea.

It has been used successfully in every U. S. war beginning with the Revolution, when it consisted of 2 battalions. It reached its high in achievement in World War II and in the Korean conflict when over 75% of its officers and men saw combat.

Selective Service Classifications

I-A: Available for military service.

I-A-0: Conscientious objector available for noncombatant military service only.

I-C: Member of Armed Forces, Coast and Geodetic Survey or Public Health Service.

I-D: Member of reserve component or student taking military training.

I-O: Conscientious objector available for civilian work contributing to maintenance of national health, safety or interest.

I-S: Student deferred by statute.

I-W: Conscientious objector performing civilian work contributing to maintenance of national health, safety or interest.

- II-A:** Registrant deferred because of civilian occupation (except agriculture and activity in study).
- II-C:** Registrant deferred because of agricultural occupation.
- II-S:** Registrant deferred because of activity in study.
- III-A:** Registrant with child or children; and registrant deferred by reason of extreme hardship and privation to dependents.

- IV-A:** Registrant who has completed service; sole surviving son.
- IV-B:** Officials deferred by law.
- IV-C:** Aliens.
- IV-D:** Minister of religion or divinity student.
- IV-F:** Physically, mentally or morally unfit.
- V-A:** Registrant over age of liability for military service.

Highest Ranking Officers in the Armed Forces

ARMY

Generals of the Army: George C. Marshall; Douglas MacArthur; Omar N. Bradley.

Generals: Maxwell D. Taylor; Henry I. Hodes; Lyman L. Lemnitzer; Willard G. Wyman; Williston B. Palmer; Isaac D. White; Cortlandt Van Rensselaer Schuyler; George H. Decker.

AIR FORCE

Generals: Nathan F. Twining; Thomas D. White; Lauris Norstad; Curtis E. LeMay; Otto P. Weyland; Earle E. Partridge; Edwin W. Rawlings; Laurence S. Kuter.

NAVY

Fleet Admirals: William D. Leahy; Chester W. Nimitz.

Admirals: Arthur W. Radford; Arleigh A. Burke; Felix B. Stump; Jerauld Wright; Robert P. Briscoe; Walter F. Boone; Harry D. Felt.

MARINE CORPS

General: Randolph McC. Pate.

Lieutenant Generals: Vernon E. Megee; Ray A. Robinson; Edwin A. Pollock; Merrill B. Twining; Verne J. McCaul.

COAST GUARD

Vice Admiral: Alfred C. Richmond, Commandant.

Rear Admiral: James A. Hirschfield, Assistant Commandant.

U. S. Military Actions Other Than Declared Wars

HAWAII (1893): U. S. Marines, ordered to land by U. S. Minister Stevens, aided the revolutionary Committee of Safety in overthrowing the native government. Stevens then proclaimed Hawaii a U. S. protectorate. Annexation, resisted by the Democratic regime in Washington, was not formally accomplished until 1898.

CHINA (1900): Boxers (a group of Chinese revolutionists) occupied Peking and laid siege to foreign legations. U. S. troops joined an "international expedition which relieved the city

PANAMÁ (1903): After Colombia had rejected a proposed agreement for relinquishing sovereignty over the Panama Canal Zone, revolution broke out, aided by promoters of the Panama Canal Co. Two U. S. warships were standing by to protect American privileges. The U. S. recognized the Republic of Panamá on Nov. 6.

DOMINICAN REPUBLIC (1904): When the Dominican Republic failed to meet debts owed to the U. S. and foreign creditors, Theodore Roosevelt declared the U. S. intention of exercising "international police power" in the Western Hemisphere whenever necessary. The U. S. accordingly administered customs and managed debt payments of the Dominican Republic from 1905-07.

NICARAGUA (1911): The possibility of foreign control over Nicaragua's canal route led to U. S. intervention and agreement. The U. S. landed Marines in Nicaragua (Aug. 14, 1912) to protect American interests there. A small detachment remained until 1933.

MEXICO (1914): Mexican Dictator Huerta, opposed by President Wilson, had the support of European governments. An incident involving unarmed U. S. sailors in Tampico led to the landing of U. S. forces on Mexican soil. Vera Cruz was bombarded by the Navy to prevent the landing of munitions from a German vessel. At the point of war, both powers agreed to mediation by Argentina, Brazil and Chile. Huerta abdicated, and Carranza succeeded to the presidency.

HAITI (1915): U. S. Marines imposed a military occupation. Haiti signed a treaty making it a virtual protectorate of the U. S. until troops were withdrawn in 1934.

MEXICO (1916): Raids by Pancho Villa cost American lives on both sides of the border. President Carranza consented to a punitive expedition lead by Gen. Pershing, but antagonism grew in Mexico. Wilson withdrew the U. S. force when war with Germany became imminent.

DOMINICAN REPUBLIC (1916): Renewed intervention in the Dominican Republic with internal administration by U. S. naval officers lasted until 1924.

	E-1—\$15.60 after 2 years; \$7.80 after 4 years.*

* For first 4 months service, pay is based at \$78.00 a month, after that it is \$83.20.

Special Incentive Pay Rates

Members of the uniformed services are entitled to receive special pay for special kinds of duty. In addition to the incentive rates for aircraft and submarine crews listed on page 413, the following types of hazardous duty receive flat rates of \$110 per month for officers and \$55 per month for enlisted personnel.

1. Frequent and regular aerial flights not as a crew member.
2. Parachute jumping as a part of military duty.
3. Duty involving exposure to lepers.
4. Duty involving demolition of explosives.
5. Submarine escape training tank duty.
6. Deep sea diving duty (including helium-oxygen diving).
7. Human acceleration or deceleration duty.
8. Low pressure chamber duty.

Medical and Dental Officers

Monthly incentive pay for medical and dental officers is based on cumulative service: 0-2 years, \$100; 2-6 years, \$150; 6-10 years, \$200; over 10 years, \$250.

Diving as in Salvage and Repair

The monthly rate is not less than \$5 or more than \$30, plus \$5 for each diving hour spent in salvage or repair operations. Pay applies to pay grades E-1 through E-7 only.

Sea and Foreign Duty

Pay grade	Monthly rate	Pay grade	Monthly rate

E-6.....	20.00	E-2.....	8.00
E-5.....	16.00	E-1.....	8.00
E-4.....	13.00		

Arlington Cemetery

Arlington National Cemetery occupies 408 acres in Virginia on the Potomac River directly opposite Washington. This land was part of the estate of John Parke Custis, Martha Washington's son, who built the mansion which later became the home of Robert E. Lee. In 1864 Arlington became a national military cemetery. Many thousands of soldiers as well as hundreds of distin-

guished Americans are buried there. The Tomb of the Unknown Soldier was erected at Arlington as a tribute to unidentified dead of World War I. Plans have been made for the return and burial nearby on May 30, 1958 of unknown Americans who lost their lives during World War II and the Korean War.

Extra Pay for Wartime Service

Act of March 3, 1847, during the Mexican War, provided for \$2 a month extra pay for "distinguished service." This continued in force beyond the war and applied in the Civil War.

In the Spanish American War, there was a 20 per cent increase of enlisted men's pay for war service.

In World War I, additional pay was offered for all types of services, usually as incentive for special qualifications as gun pointer, expert rifleman, etc. Among these items is pay for certificate of merit of \$2 a month. By the new law passed in 1920, the number of reasons for additional pay had expanded. Recipients of the Medal of Honor, Distinguished Service Cross and Distinguished Service Medal received \$2 a month extra, while each bar in lieu of these medals also

added another \$2 a month. Added to this was a foreign service bonus of 20 per cent.

Act of June 30, 1944 authorized compensation of \$5 a month to enlisted men qualified as expert infantrymen and \$10 to those qualified as combat infantrymen. These amounts were payable for the duration of war and six months thereafter.

By the Act of July 6, 1945 for the duration of war and for six months thereafter enlisted men entitled to wear Medical Badges received additional pay of \$10.

Act of July 10, 1952 authorized \$45 a month for each month beginning after May 31, 1950, for which the member was entitled to receive basic pay and during which he was a member of a combat unit in Korea. This applies to officers and enlisted men.

ALLOWANCES FOR SUBSISTENCE

Officers receive \$47.88 per month. Enlisted personnel receive allowances for subsistence under the following provisions: (1) when rations in kind are not available, \$2.57 per day; (2) when permission to mess separately is granted, \$1.05 per day; (3) when assigned to duty under emergency conditions where no government messing facilities are available, up to and not to exceed \$3.42 per day.

¹ Includes deaths from all causes. ² Official figures.

Veterans' Benefits

Veterans of World War I were the first in our history to receive compensation for injuries, allotments for the support of dependents, life insurance, medical care and vocational rehabilitation. Beginning with 1940, these benefits were slowly broadened.

The following benefits available to veterans of World War II and the Korean War have specific time limitations and, in most cases, are applicable only to those whose discharge was not under dishonorable conditions.

Education and Training: *Veterans of the Korean War:* For a maximum period of 1½ times the duration of active service, not exceeding 36 months, the VA pays sums varying from \$110 to \$160 per month toward subsistence, tuition, supplies, etc.

Re-employment: The veteran is to be reinstated in the same position or an equivalent one unless, in the case of a private employer, changed circumstances make this impossible.

Unemployment allowances: Korea veterans out of work are entitled to unemployment allowances of \$26 a week for up to 26 weeks. Application should be made to the local state employment office.

Loans: Only loans for the purchase or construction of a home, to buy a farm and farm equipment or business property and equipment, are permissible. The VA will guarantee the lender against loss up to 60% of a home loan with a maximum of \$7,500. On other loans, the guarantee is up to 50% with a maximum of \$4,000 involving real estate and \$2,000 on non-real estate loans. The interest rate in all cases must not exceed 4½% per year.

The following benefits are also available to those having some service-connected illness or disability:

Disability Compensation: The VA pays from \$19 to \$225 per month with additional sums for specific conditions up to \$450 per month, plus allowances for wife, children or dependent parents.

Vocational rehabilitation: Necessary training expenses, special equipment, etc., toward a definite job objective are paid for, plus a monthly allowance varying from \$65 to \$120 in addition to compensation.

Medical and dental care: This includes complete care in VA or certain other Federal hospitals. It also covers treatment (not requiring hospitalization) at a VA field station or by an approved private physician or dentist. Medicine, instruments, appliances, mechanical equipment, etc., are supplied. Full domiciliary care is also provided where necessary.

War Orphans Education: \$110 a month for up to 36 months of schooling may be paid to sons and daughters of veterans who died of service-connected causes. Students must usually be between 18 and 23.

Death benefits: Up to \$10,000 of GI Insurance may be paid to the beneficiaries of deceased veterans. Compensation to a widow is \$75 per month, with an allowance for each child.

NOTE: Since our space has permitted only a general statement of the principal benefits available to veterans, the reader is referred to his local office of the Veterans' Administration (VA) for detailed information.

U. S. Postal Regulations

Source: U. S. Post Office.

FIRST CLASS:

Letters and written and sealed matter: 3¢ for each oz., except that drop letters are subject to 2¢ for each oz. when deposited for local delivery at offices not having letter-carrier service, provided they are not collected or delivered by rural or star-route carriers.

Government postal cards: single, 2¢; double, 4¢.

Private mailing or post cards: 2¢.

Limit of size: Min. size, $2\frac{3}{4}$ " x 4"; no max.

Limit of weight when mailed from one first-class post office to another: 40 lb. in local, first and second zones, 20 lb. in third to eighth zones.

Limit of weight when mailed to or from second-, third- and fourth-class post offices: 70 lb.

AIRMAIL (LIMIT 8 OZ.):

6¢ for each oz. or fraction thereof within the continental U. S., within any Territory or possession of the U. S., or between any of the foregoing. This includes airmail to or from Alaska, Hawaii, Puerto Rico, Virgin Islands of the U. S., Canton Island, Canal Zone, Guam and any other place where the U. S. mail service is in operation.

Post cards: 4¢.

AIR PARCEL POST (OVER 8 OZ. TO 70 LB.):

The zone rates below shall apply to mailable matter of any class carried by air. Such matter shall not exceed 100 in. in length and girth combined, including written and other matter of the first class, whether sealed or unsealed. Fractions of a lb. are charged as a full lb.

Parcels weighing less than 10 lb. and measuring more than 84 in., but not more than 100 in. in length and girth combined, shall be subject to the 10-lb. rate.

Air Parcel-Post Zone Rates

Zone and (miles)	First lb.	Addl. lbs.
First, Second & Third (to 300) .	60¢	48¢
Fourth (300-600)	65¢	50¢
Fifth (600-1,000)	70¢	56¢
Sixth (1,000-1,400)	75¢	64¢
Seventh (1,400-1,800)	75¢	72¢
Eighth (over 1,800)	80¢	80¢

The eighth-zone rate shall be charged on air parcel post between the U. S. or its Territories and possessions and overseas A.P.O.'s and Fleet post offices, as well as naval vessels and commands afloat addressed in care of Fleet post offices at New York or San Francisco.

Limit of size to A.P.O. or F.P.O.: 30 in. length and girth; limit of weight: 2 lb.

Air parcels mailed at New York, N. Y., and addressed to Puerto Rico and the Virgin Is. are subject to the seventh-zone rate.

SECOND CLASS (NO WEIGHT LIMIT):

Newspapers, magazines and other periodicals containing notice of second-class entry.

For rates for publications mailed by the publishers or registered news agents, consult local postmaster.

Transient rate for matter mailed by others than the publishers or registered news agents: 2¢ for the first 2 oz., 1¢ for each additional 2 oz. However, if the fourth-class rate is cheaper, it shall apply.

THIRD CLASS (LIMIT 8 OZ.):

Merchandise, books, printed matter and all other mailable matter not in first or second class.

Regular rate: 2¢ for the first 2 oz., 1¢ for each additional oz. Books and catalogs of 24 pages or more, seeds, cuttings, bulbs, etc.: 2¢ for the first 2 oz., $1\frac{1}{2}$ ¢ for each additional 2 oz.

Bulk rate: for \$10 per year or fraction thereof, separately addressed identical pieces of third-class matter in quantities of not less than 20 lb. or of not less than 200 pieces are subject to the lb. rates of postage applicable to the entire bulk mailed at one time.

The bulk rate for miscellaneous printed matter, etc. is 14¢ for each lb., with a minimum charge of $1\frac{1}{2}$ ¢ per piece. For books and catalogs of 24 pages or more, seeds, etc., the rate is 10¢ for each lb., with a minimum charge of $1\frac{1}{2}$ ¢ per piece.

Pieces of such size or form as to prevent ready facing and tying in bundles and requiring individual distributing throughout mailed singly or in bulk are subject to a minimum charge of 3¢ each.

FOURTH CLASS (PARCEL POST) (OVER 8 OZ.):

Merchandise, books, printed matter and all other mailable matter not in first, second or third classes.

The zone rates below shall apply to fourth-class matter, except catalogs, books, library books, publications or records for the blind, and certain controlled circulation publications.

Limit of size*: 72 in. in length and girth combined.

Limit of weight*: over 8 oz. to 40 lb. in local, first and second zones, over 8 oz. to 20 lb. in third to eighth zones.

Note: The following five items have a size limit of 100 in. in length and girth

* When mailed from one first-class post office to another.

combined, a weight limit of over 8 oz. to 70 lb.: (1) parcels sent to or from rural or star routes; (2) parcels sent to or from second-, third-, and fourth-class post offices; (3) parcels containing baby fowl, live plants, trees, shrubs, or agricultural commodities (not including manufactured products thereof); (4) parcels containing books; (5) parcels mailed between the U. S. and any Army or Fleet post office or between the U. S. and any Territory or possession of the U. S.

Fourth-Class Zone Rates

Zone and (miles)	First lb.	Addl. lbs.
Local	\$.18	\$.0145
First & Second (to 150) *	.23	.0395
Third (150-300)	.23	.0515
Fourth (300-600)	.24	.0690
Fifth (600-1,000)	.26	.0925
Sixth (1,000-1,400)	.28	.1195
Seventh (1,400-1,800)	.30	.1520
Eighth (over 1,800)	.32	.1805

* In the 1st or 2nd zone, where the distance by the shortest practicable mail route is 300 mi. or more, the rate shall be the same as for the 3rd zone.

The zone rates below shall apply to individually addressed catalogs and similar printed advertising matter in bound form weighing more than 8 oz. but not exceeding 10 lb.

Catalog Zone Rates*

Zone and (miles)	First lb.	Addl. half-lbs.
Local	\$.12	\$.0075
First & Second (to 150)†	.13	.0150
Third (150-300)	.14	.0200
Fourth (300-600)	.15	.0250
Fifth (600-1,000)	.17	.0325
Sixth (1,000-1,400)	.18	.0400
Seventh (1,400-1,800)	.19	.0500
Eighth (over 1,800)	.20	.0600

* Fractions of one-half cent or less are counted as one-half cent; fractions of a cent exceeding one-half cent are counted as one cent in the total amount.

† In the 1st or 2nd zone, where the distance by the shortest practicable mail route is 300 mi. or more, the rate shall be the same as for the 3rd zone.

BOOKS (LIMIT 70 LB.):

Books (containing no advertising matter other than incidental announcements of books), 16-mm. film in final state for viewing and 16-mm. film catalogs: 8¢ first lb., 4¢ each additional lb. (Rate applies for films and catalogs except when mailed to commercial theaters.) Must be endorsed "book."

LIBRARY BOOKS (LIMIT 70 LB.):

Books sent by authorized libraries to readers and when returned by such readers, for delivery within the first three zones or the state in which mailed: 4¢ first lb., 1¢ each additional lb.

SPECIAL DELIVERY AND SPECIAL HANDLING:

The prepayment of the special-delivery

fee entitles mail to the most expeditious handling and special delivery.

Prepayment of the special-handling fee entitles fourth-class matter to the most expeditious handling, transportation and delivery possible, but not special delivery.

Special Delivery and Special Handling

Weight	Special delivery			Special handling (4th class only)
	First class*	2nd, 3rd, 4th class		
Up to 2 lb.	30¢	45¢		25¢
2 to 10 lb.	45¢	55¢		35¢
Over 10 lb.	60¢	70¢		50¢

* Including air parcel post.

MONEY ORDERS:

Money orders for amounts from 1¢ to \$100 are issued upon written application* made by the remitter or his agent showing the amount of the order and the names and addresses of payee and remitter.

Amount of order	Fee
\$.01 to \$ 5.00	15¢
5.01 to 10.00	20¢
10.01 to 100.00	30¢

* As of Oct. 1, 1955, 1st- and 2nd-class post offices will issue money orders without written application.

REGISTERED MAIL:

¹ Postal liability: declared value. ² Postal liability: Declared value or prorated. ³ Postal liability: \$1,000 maximum or prorated. ⁴ Postal liability: \$10,000. ⁵ Fee increased 15 cents per \$1,000 or fraction above \$10,000. ⁶ Fee increased 10 cents per \$1,000 or fraction above \$1,000,000. ⁷ Additional fee charges may be applied based on consideration of weight, space and value.

Restricted delivery, 50¢. Return receipts: showing to whom and when delivered, 10¢; to whom, when and address where delivered, 35¢; requested after mailing, showing to whom and when delivered, 25¢.

CERTIFIED MAIL:

Certified mail service provides for a receipt to the sender and a record of delivery at the office of address. No record is kept at the office where mailed. It is handled in the ordinary mails and no insurance coverage is provided.

Only first-class mail having no value will be accepted as certified mail. This does not exclude articles of a non-negotiable character and other matter which would involve a cost of duplication if lost or destroyed. The mail may be sent by air on payment of the required postage. Return receipt service requested at the time of mailing only, and special delivery service are available.

Fees are as follows: Fee in addition to postage, 20¢; return receipt showing to whom and when delivered, 10¢; return receipt showing to whom, when, and address where delivered, 35¢; restricted delivery, 50¢.

INSURED MAIL:

Fees for domestic insured mail (third- and fourth-class matter):

Insurance coverage	Fee
\$ 0.00 to \$ 10.00	10¢
10.01 to 50.00	20¢
50.01 to 100.00	30¢
100.01 to 200.00	40¢

C.O.D. MAIL:

Fees for domestic unregistered C.O.D. mail (third- and fourth-class matter and sealed domestic mail matter of any class bearing postage at the first-class rate):

Indemnity limit	Fee
\$.01 to \$ 5.0030
5.01 to 10.0040
10.01 to 25.0060
25.01 to 50.0070
50.01 to 100.0080
100.01 to 150.0090
150.01 to 200.00	1.00

Fees for domestic registered C.O.D. mail (sealed domestic mail of any class bearing postage at the first-class rate):

Amount collectible and indemnity payable	Fee
\$.01 to \$ 10.0080
10.01 to 50.00	1.10

600.01 to 700.00	1.90
700.01 to 800.00	2.00
800.01 to 1000.00	2.10

MISCELLANEOUS:

In registered and insured mail, a receipt card will be returned to the sender upon request. When a card is requested showing to whom and when the delivery was made, the rate is 10¢ if the request is made at the time of mailing, 25¢ if made thereafter. When a card is requested showing to whom and when the delivery was made and the address, the rate is 35¢ and must be paid at the time of mailing.

Fees for effecting delivery of domestic registered, insured, and C.O.D. mail to addressee only or to addressee or order: 50¢.

Fee for notifying sender or his representative of inability to deliver a C.O.D. article: 5¢.

Certificates of mailing for ordinary mail of any class: 5¢ for each article described thereon. Additional certificates for ordinary, registered, insured and C.O.D. mail: 2¢ for each article described thereon.

C.O.D. mail cannot be sent to Navy personnel on board ships or at overseas shore stations.

FOREIGN REGULAR MAIL:

Letters and letter packages: To Canada and Mexico, 3¢ per oz. or fraction. To all other countries, 8¢ for 1st oz., 4¢ per additional oz. or fraction. Weight limit: 4 lb. 6 oz. (60 lb. to Canada).

Post cards: To Canada and Mexico, 2¢ each, 4¢ with reply paid. To all other countries, 4¢ each, 8¢ with reply paid.

FOREIGN AIRMAIL:

Air-letter sheets: Air letters, consisting of sheets which can be folded into the form of an envelope and sealed, are acceptable for dispatch by airmail at a uniform rate of 10¢ each to all foreign countries. The sheets are sold at all post offices at 10¢ each. No enclosures, adhesive tape or stickers are permitted.

Letters and letter packages: See table for rates.

¹ For letters and letter packages. Unless otherwise indicated, rate shown is per each $\frac{1}{2}$ oz., and weight is limited to 4 lb., 6 oz. For rates for commercial papers, printed matter, samples of merchandise, small packages, 8-oz. merchandise packages, combination packages and articles grouped together, consult local postmaster. ² Rate for 4 oz. or fraction thereof. ³ Rate for each additional 4 oz. or fraction thereof. ⁴ Parcels for Brazil exceeding 22 lb. accepted for following offices only: Belem (Para), Belo Horizonte, Florianopolis, Fortaleza, Manaus, Pelotas, Porto Alegre, Recife (Pernambuco), Rio de Janeiro, Rio Grande (Rio Grande do Sul), Salvador (Bahia), Santos and Sao Paulo. ⁵ Per oz.; post cards each 4c. ⁶ Articles limited to 60 lb. in weight. ⁷ Registered and ordinary articles in regular mails for Island of Formosa (Taiwan) will be accepted for air transmission to destination. ⁸ Parcels for many offices are limited to 22 lb. or 7 lb. Consult local postmaster for limitations. ⁹ Service to Cuba is limited to parcels weighing over 8 oz. and up to 22 lb. Cost for initial weight unit, which is over 8 oz. and up to 12 oz., is \$1.10. Each additional 4 oz. or fraction is 15c. Packages weighing 8 oz. or less must not have customs declarations or parcel post stickers attached. ¹⁰ Parcels for Honduras exceeding 22 lb. accepted for following offices only: Amapala, Comayagua, La Kelba, Olanchito, Progreso, Puerto Castilla, Puerto Cortez, San Pedro Sula, Tegucigalpa and Tela. ¹¹ Air parcels for Saudi Arabia limited to the following places only: Al Gaba, Al Lih, Al Weh, Daba, Danmam, Dhahran, Hassa, Jiddah, Jizam, Katif, Khobar, Mecca, Medina, Qunfda, Rabigh, Rastanurra, Rivadh, Umm Lej and Yenbo. ¹² Limit to Chahba and Sakhad is 11 lb.; limit to Tel-Abiad and Yabroud is 22 lb. ¹³ Parcels for Lebanon exceeding 11 lb. not accepted for following offices: Ain-Zhalta, Baido, Falougha, Hermel, Koubayat, Maaser-el-Chour, Ras-Baalbeck and Souk-el-Gharb. NOTE: For rates to countries not shown in this table, consult local postmaster. Leaders (....) indicate that there is no air-parcel-post service to the country.

HOW A PRESIDENT IS ELECTED

Selection of Delegates

FIRST, AT FULL DRESS MEETINGS several months before, the national committees decide the time and place of the conventions. Before the conventions meet, each party selects delegates from every state and territory.

Democrats allow 2 delegates with 1 vote apiece for each Senator, or 4 delegates with $\frac{1}{2}$ vote apiece. Two delegates are allowed for each Congressman. Also, a bonus vote of 4 is allowed each state that went Democratic in the last Presidential election. These states may elect 8 delegates with $\frac{1}{2}$ vote each. Six delegates each are allowed to Puerto Rico, D. C., Alaska, and Hawaii, and 2 each to the Canal Zone and the Virgin Islands.

Republicans allow each state 4 delegates-at-large and 2 for each Representative-at-large, as well as 6 additional delegates if the state went Republican in the previous Presidential election or, in that election or a subsequent one held prior to the next Republican National Convention, elects a Republican U. S. Senator or Governor. In addition, each Congressional district within the state that cast 2,000 Republican votes at the last election is permitted a delegate, with an additional delegate if that district cast 10,000 votes. Republicans further allow 4 delegates-at-large for Alaska, 6 for D. C., 6 for Hawaii (plus 4 for having elected a Delegate to Congress), 3 for Puerto Rico and 1 for the Virgin Islands.

Each party provides for the selection of an equal number of alternates to serve in the absence of the regular delegates. Delegates are chosen differently in the different states.

The Conventions

At each convention a temporary chairman is chosen, usually to deliver the party's keynote speech. After a credentials committee seats the various delegates, a permanent chairman is elected. The convention then votes on a platform, drawn up by the platform committee.

By the third or fourth day, Presidential nominations begin. The chairman calls the roll of states alphabetically. A state may place a candidate in nomination or yield to another state.

Voting, again alphabetically by voice vote, begins after all nominations have been made and seconded. A simple majority is required in each party, although this may require many ballots.

Finally, the Vice Presidential candidate is selected. Although there is no law saying that the candidates *must* come from different states, it is practically necessary for this to be the case. Otherwise, accord-

ing to the Constitution (see Amendment XII), electors from that state could vote for only one of the candidates and would have to cast their other vote for some person of another state. This could result in the awkward situation of a Presidential candidate's receiving a majority electoral vote and his running mate's failing to.

The Electoral College

The next step in the process is the nomination of electors in each state, according to its laws. These electors must not be Federal office holders. In the November election, the voters cast their votes for electors, not for President. In some states, the ballots include only the names of the Presidential and Vice Presidential candidates; in others, they include only names of the electors. Nowadays, it is rare for electors to be split between parties. The last such occurrence was in Tennessee in 1948; the last before that, in West Virginia in 1916. On three occasions (1824, 1876 and 1888), the candidate with the largest popular vote failed to obtain an electoral-vote majority.

Each state has as many electors as it has United States Senators and members of the House of Representatives. There are 96 Senators and 435 Representatives, a total of 531 electoral votes, of which 266 are needed to win.

On the first Monday after the second Wednesday in December, the electors cast their votes in their respective state capitols. Constitutionally they may vote for someone other than the party candidate but practically they cannot since they are pledged to one party and its candidate on the ballot. Should the Presidential or Vice-Presidential candidate die between the November election and the December meetings, the electors pledged to vote for him could vote for whomever they pleased. However, it seems certain that the national committee would attempt to get an agreement among the state party leaders for a replacement candidate.

The votes of the electors, certified by the states, are sent to Congress, where the president of the Senate opens the certificates and has them counted in the presence of both Houses on January 6. The new President is inaugurated at noon on January 20.

Should no candidate receive a majority of the electoral vote for President, the House of Representatives chooses a President from among the three highest candidates, voting, not as individuals, but as states, with a majority (now 25) needed to elect. Should no Vice Presidential candidate obtain the majority, the Senate, voting as individuals, chooses from the highest two.

¹ The Convention adopted the name Union party so as to attract War Democrats and others favoring prosecution of the war. ² In session until July 10, 1924. ³ 103d ballot. ⁴ States' Rights delegates from 13 Southern states. ⁵ Progressive party.

Presidential Succession

The following is the order of the succession to the Presidency. No person may become President, however, unless he is eligible under the Constitution.

1. Vice President of the U. S.
2. Speaker of the House.
3. President pro tempore of the Senate.
4. Secretary of State.
5. Secretary of the Treasury.
6. Secretary of Defense.
7. Attorney General.
8. Postmaster General.
9. Secretary of the Interior.
10. Secretary of Agriculture.
11. Secretary of Commerce.
12. Secretary of Labor.

Presidential Elections, 1789 to 1956

Year	Presidential candidates	Party	Electoral vote	Year	Presidential candidates	Party	Electoral vote
1789 ^{1,2}	George Washington	(no party)	69	1796 ¹	John Adams	Federalist	71
	John Adams	(no party)	34		Thomas Jefferson	Dem.-Rep.	68
	Scattering	(no party)	35		Thomas Pinckney	Federalist	59
	Votes not cast		8		Aaron Burr	Dem.-Rep.	30
1792 ¹	George Washington	Federalist	132	1800 ^{1,3}	Scattering		48
	John Adams	Federalist	77		Thomas Jefferson	Dem.-Rep.	73
	George Clinton	Anti-Federalist	50		Aaron Burr	Dem.-Rep.	73
	Thomas Jefferson	Anti-Federalist	4		John Adams	Federalist	65
	Aaron Burr	Anti-Federalist	1		Charles C. Pinckney	Federalist	64
	Votes not cast		6		John Jay	Federalist	1

¹ For the original method of electing the President and the Vice President, see Article II, Section 1, of the Constitution. ² Only 10 states participated in the election. The New York legislature chose no electors, and North Carolina and Rhode Island had not yet ratified the Constitution. ³ As Jefferson and Burr were tied, the House of Representatives chose the President. In a vote by states, 10 votes were cast for Jefferson, 4 for Burr; 2 votes were not cast.

	Votes not counted ⁹		23	Votes not counted ⁹		23

¹ The first election in which the electors voted for President and Vice President on separate ballots. (See Amendment XII to the Constitution.) ² As no candidate had an electoral-vote majority, the House of Representatives chose the President from the first three. In a vote by states, 13 votes were cast for Adams, 7 for Jackson, and 4 for Crawford. ³ The Antimasonic party. On Sept. 26, 1831, was the first party to hold a nominating convention to choose candidates for President and Vice President. ⁴ As Johnson did not have an electoral-vote majority, the Senate chose him 33-14 over Granger, the others being legally out of the race. ⁵ Harrison died Apr. 4, 1841, and Tyler succeeded him Apr. 6. ⁶ Taylor died July 9, 1850, and Fillmore succeeded him July 10. ⁷ Also known as the Know-Nothing party. ⁸ Lincoln died Apr. 15, 1865, and Johnson succeeded him the same day. ⁹ 23 Southern electoral votes were excluded. ¹⁰ Name adopted by the Republican National Convention of 1864. Johnson was a War Democrat.

NOTE: For minor party vote and candidates, see tables on following pages for 1948-1956.

¹ For those candidates receiving over 75,000 votes. ² Greeley died Nov. 29, 1872, before his 66 electors voted. In the electoral balloting for President, 63 of Greeley's votes were scattered among Hendricks, Brown, Jenkins and Davis; the other 3, included in "Votes not counted," were cast for Greeley by electors from Georgia. This was the first election in which every state chose its electors by popular vote. ³ After the voting of the electoral college, Tilden had 184 undisputed votes, and Hayes 163. However, 22 other votes were in doubt, because two sets of electoral ballots were received from South Carolina, Louisiana, Florida and Oregon. For each of the three Southern states, one set was completely Democratic, the other completely Republican. For Oregon, one set gave all 3 of the state's votes to Hayes, the other gave one of the votes to Tilden. To settle the dispute, Congress created an Electoral Commission on Jan. 29, 1877. This Commission, consisting of 5 Supreme Court justices, 5 senators and 5 representatives (8 Republicans and 7 Democrats), gave the 22 votes in question to Hayes. ⁴ Garfield died Sept. 19, 1881, and Arthur succeeded him Sept. 20. ⁵ The members of the People's party were known as Populists. ⁶ McKinley died Sept. 14, 1901, and Roosevelt succeeded him the same day. ⁷ James S. Sherman, Republican candidate for Vice President, died Oct. 30, 1917, and the Republican electoral votes were cast for Butler. ⁸ Harding died Aug. 2, 1923, and Coolidge succeeded him Aug. 3. ⁹ Roosevelt died Apr. 12, 1945, and Truman succeeded him the same day. ¹⁰ One electoral vote from Alabama was cast for Walter B. Jones.

Presidential Election of 1948

CANDIDATES FOR PRESIDENT AND VICE PRESIDENT

Democratic—Harry S. Truman, Missouri; Alben Barkley, Kentucky.

Republican—Thomas E. Dewey, New York; Earl Warren, California.

States' Rights Democratic—J. Strom Thurmond, South Carolina; Fielding L. Wright, Mississippi.

Progressive—Henry A. Wallace, Iowa; Glen H. Taylor, Idaho.

Socialist—Norman Thomas, New York; Tucker P. Smith, Michigan.

Prohibition—Claude A. Watson, California; Dale Learn, Pennsylvania.

Socialist Labor—Edward A. Teichert, Pennsylvania; Stephen Emery, New York.

¹ Registration of all or part of the voters is required in most states. ² Annual levy. Although poll (or head) taxes are levied in several other states, those listed make payment of the tax a condition for voting. ³ Precinct or ward. ⁴ Precinct. ⁵ City or town, and 15 days in precinct. ⁶ City or town. ⁷ Minimum voting age is 18; in all other states it is 21. ⁸ First paper must have been taken out. ⁹ Township. ¹⁰ Township or ward. ¹¹ Parish. ¹² Must be able to read any section of state constitution. ¹³ 6 months if previously qualified elector or natural-born citizen of state. ¹⁴ 1953 act makes poll tax noncumulative except for 2 years preceding election in which elector offers to vote. ¹⁵ To qualify to vote for representatives to general assembly or justices. ¹⁶ County, city, or town. ¹⁷ City, town, ward, or precinct. ¹⁸ Repealed in 1945. ¹⁹ Precinct; municipality 4 mo. ²⁰ A person must take freeman's oath as qualification for voting. ²¹ \$1.50 levied by state; 25 cents levied by most counties, but not all. ²² To vote for county officials requires 30 days residence in the county; for municipal officials, 30 days in the municipality. State residents may vote in national and state-wide elections without 30 days local residence. ²³ Residents of less than one year may vote in presidential elections if eligible to vote elsewhere prior to moving.

Plurality and Majority

In order to win a plurality, a candidate must receive a greater number of votes than anyone running against him. If he receives 50 votes, for example, and two other candidates receive 49 and 2, he will have a plurality of one vote over his closest opponent.

However, a candidate does not have a majority unless he receives more than 50% of the total votes cast. In the example above, the candidate does not have a majority, because his 50 votes are less than 50% of the 101 votes cast.

If only two candidates receive votes, a plurality is necessarily a majority; but if more than two candidates receive votes, it is possible for one to have a plurality without a majority.

BIOGRAPHIES OF THE PRESIDENTS

GEORGE WASHINGTON

was born February 22, 1732 (February 11, 1731/2, old style) in Westmoreland County, Virginia. He early trained as a surveyor; but in 1752 he was appointed adjutant in the Virginia militia, and for the next three years he took an active part in the wars against the French and Indians, serving as General Braddock's aide in the disastrous campaign against Fort Duquesne. In 1759 he resigned from the militia, married Martha Dandridge Custis, a widow, and settled down as a gentleman farmer at Mount Vernon.

As a militiaman, he had been exposed to the arrogance of the British officers, and his experience as a planter with British commercial restrictions increased his anti-British sentiment. He opposed the Stamp Act of 1765 and after 1770 became increasingly prominent in organizing resistance. A delegate to the Continental Congress, Washington was selected as commander in chief of the Continental Army and took command at Cambridge, Massachusetts, on July 3, 1775.

Inadequately supported and sometimes covertly sabotaged by the Congress, in charge of troops who were inexperienced, badly equipped and impatient of discipline, Washington conducted the war on the policy of avoiding major engagements with the British and wearing them down by harassing tactics. His able generalship, along with the French alliance and the growing weariness within Britain, brought the war to a conclusion with the surrender of Cornwallis at Yorktown on October 19, 1781.

The chaotic years under the Articles of Confederation led Washington to return to public life in the hope of promoting the formation of a strong central government. He presided over the Constitutional Convention and yielded to the universal demand that he serve as first President. In office, he sought to unite the nation in the service of establishing the authority of new government at home and abroad. Greatly distressed by the emergence of the Hamilton-Jefferson rivalry, he worked to maintain neutrality but actually sympathized more with Hamilton. Following his unanimous re-election in 1792, his second term was dominated by the Federalists. His Farewell Address rebuked party spirit and warned against foreign entanglements.

He died at Mt. Vernon on December 14, 1799. Tall, dignified and impressive, Washington gave a public impression of austerity, though he was capable of gaiety in private. His life was characterized by a

strict sense of duty to his people. The standard biographies are by Fitzpatrick, Ford, Hughes and Stephenson.

JOHN ADAMS

was born on October 30 (October 19, old style), 1735, at Braintree (now Quincy), Massachusetts. A Harvard graduate, he considered teaching and the ministry but finally turned to law and was admitted to the bar in 1758. He opposed the Stamp Act, served as lawyer for patriots indicted by the British and, by the time of the Continental Congresses, was in the vanguard of the movement for independence. In 1778 he went to France as commissioner. Subsequently he helped negotiate the peace treaty with Britain, and in 1785 became the U. S. envoy to London. Resigning in 1788, he was elected Vice President under Washington, and was re-elected in 1792.

Though a Federalist, Adams did not get along with Hamilton who sought to prevent his election to the presidency in 1796, and thereafter intrigued against his administration. Adams was chosen with 71 electoral votes to 68 for his closest competitor, Thomas Jefferson, who became Vice President. In 1798 Adams' independent policy averted a war with France but completed the break with Hamilton and the right-wing Federalists while, at the same time, the enactment of the Alien and Sedition Acts, directed against foreigners and against critics of the government, exasperated the Jeffersonian opposition. The split between Adams and Hamilton elected Jefferson in 1800. Adams retired to his home in Quincy, Massachusetts. He later corresponded with Jefferson and they died on the same day, July 4, 1826.

Stout, somewhat vain and irascible, Adams was honest, fearless and essentially fair-minded. His *Defence of the Constitutions of Government of the United States* (1787) contains original and striking if conservative political ideas. He married Abigail Smith in 1764, and their life together was long and happy. The standard biographies are by Morse and Chinard.

THOMAS JEFFERSON

was born on April 13 (April 2, old style), 1743, at Shadwell in Goochland (now Albemarle) County, Virginia. A William and Mary graduate, he studied law but from the start showed an interest in science and philosophy. His literary skill and political clarity brought him to the forefront

of the revolutionary movement in Virginia. As delegate to the Continental Congress, he drafted the Declaration of Independence. In 1776 he entered the Virginia House of Delegates and initiated a comprehensive reform program for the abolition of feudal survivals in land tenure and the separation of church and state.

In 1779 he became governor, but constitutional limitations on his power combined with his own lack of executive energy caused an unsatisfactory administration, culminating in Jefferson's virtual abdication when the British invaded Virginia in 1781. He now retired to his beautiful home at Monticello, to his wife, Martha Wayles Skelton, whom he had married in 1772 and who died in 1782, and to his children.

Jefferson's *Notes on Virginia* (1784-85) illustrate his many-faceted interests, his limitless intellectual curiosity, his deep faith in agrarian democracy. Sent to Congress in 1783, he helped lay down the decimal system and drafted basic reports on the organization of the western lands. In 1785 he was appointed minister to France, where the Anglo-Saxon liberalism he had drawn from Locke was stimulated by contact with the thought which would soon ferment in the French Revolution. In 1789 Washington appointed him Secretary of State. While favoring the Constitution and a strengthened central government, Jefferson came to believe that Hamilton contemplated the establishment of a monarchy. Growing differences resulted in Jefferson's resignation on Dec. 31, 1793.

Elected Vice President in 1796, Jefferson continued to serve as spiritual leader of the opposition to Federalism, particularly to the repressive Alien and Sedition Acts. He was elected President in 1801 by the House of Representatives as a result of Hamilton's decision to throw the Federalist votes to him rather than to Aaron Burr, who had tied him in electoral votes. The purchase of Louisiana from France in 1803, though in violation of his earlier constitutional scruples, was the most notable act of his administration. Re-elected in 1804 with 162 electoral votes to 14 for the Federalist Charles C. Pinckney, Jefferson tried desperately during his second term to keep the United States out of the Napoleonic Wars in Europe, employing to this end the unpopular embargo policy.

After his retirement to Monticello in 1809, he developed his interest in education, founding the University of Virginia and watching its development with never-flagging interest. He died at Monticello on July 4, 1826. Tall, loose-jointed, a poor speaker, Jefferson had an enormous variety of interests and skills, ranging from education and science to architecture and music. Economically his conception of democracy presupposed an essentially rural

community of small freeholds; but his deep and abiding faith in the common man provides inspiration for future generations. The standard biographies are by Chinard, Bowers, Kimball, Randall and Malone.

JAMES MADISON

was born in Port Conway, Virginia, on March 16, 1751 (March 5, 1750/1, old style). A Princeton graduate, he joined the struggle for independence on his return to Virginia in 1771. In the seventies and eighties he was active both in state politics, where he championed the Jefferson reform program, and in the Continental Congress. He was influential in the Constitutional Convention as leader of the group favoring a strong central government and as recorder of the debates; and he subsequently wrote, in collaboration with Alexander Hamilton and John Jay, the *Federalist* papers to aid the campaign for the adoption of the Constitution.

In the new Congress, Madison soon emerged as the leader in the House of the men who opposed Hamilton's financial program and his pro-British leanings in foreign policy. Retiring from Congress in 1797, he continued active in Virginia and drafted the Virginia Resolution protesting the Alien and Sedition Acts. His intimacy with Jefferson made him natural choice for Secretary of State in 1801.

In 1809 Madison succeeded Jefferson as President, with 122 electoral votes to 47 for the Federalist, C. C. Pinckney, and 6 scattering. His attractive wife, Dolly Payne Todd, whom he married in 1794, brought a new social sparkle to the executive mansion. In the meantime, increasing tension with Britain culminated in the War of 1812—a war for which the United States was unprepared, and for which Madison lacked the executive talent to clear out incompetence and mobilize the nation's energies. Madison was re-elected in 1812, with 128 electoral votes to 89 for the Federalist, De Witt Clinton. In 1814 the British actually captured Washington and forced Madison to flee to Virginia.

In his domestic program, Madison capitulated to the Hamiltonian policies that he had resisted twenty years before, signing bills to establish a United States Bank and a higher tariff. Following his presidency, he remained in retirement in Virginia until his death on June 28, 1836. Small, wrinkled, unimpressive, Madison had an acute political intelligence but lacked executive force. The standard lives are by Hunt, Brant and Rives.

JAMES MONROE

was born on April 28, 1758, in Westmoreland County, Virginia. A William and Mary graduate, he served in the army during

the first years of the Revolution and was wounded at Trenton. He then entered Virginia politics and later national politics under the sponsorship of Jefferson. In 1786 he married Eliza Kortright.

Fearing centralization, Monroe opposed the adoption of the Constitution and, as senator from Virginia, was highly critical of the Hamiltonian program. In 1794 he was appointed minister to France where his ardent sympathies with the Revolution exceeded the wishes of the State Department. A troubled diplomatic career ended with his recall in 1796. From 1799 to 1802 he was governor of Virginia. In 1803 Jefferson sent him to France to help negotiate the Louisiana Purchase and for the next few years he was active in various continental negotiations.

In 1808 Monroe flirted with the radical wing of the Republican party, which opposed Madison's candidacy; but the presidential boom came to naught and, after a brief term as governor of Virginia in 1811, Monroe accepted Madison's offer of the State Department. During the war he vainly sought a field command and served as Secretary of War from Sept., 1814, to Mar., 1815.

Elected President in 1816 with 183 electoral votes to 34 for the Federalist Rufus King, and re-elected without opposition in 1820, Monroe, the last of the Virginia dynasty, pursued the course of systematic tranquilization which won for his terms the name "the era of good feeling." He continued Madison's surrender to the Hamiltonian domestic program, signed the Missouri Compromise, acquired Florida and, with the able assistance of his Secretary of State, John Quincy Adams, promulgated the Monroe Doctrine in 1823, declaring against foreign colonization or intervention in the Americas. He died in New York City on July 4, 1831.

A sound man of medium abilities, Monroe possessed qualities of judgment rather than of leadership. The standard biographies are by Morgan, Gilman and Styron.

JOHN QUINCY ADAMS

was born on July 11, 1767, at Braintree (now Quincy), Massachusetts, the son of John Adams. He spent his early years in Europe with his father, graduated from Harvard and entered law practice. His anti-Jeffersonian newspaper articles won him political attention. In 1794 he became minister to the Netherlands, the first of several diplomatic posts which occupied him until his return to Boston in 1801. In 1797 he married Louisa Catherine Johnson.

In 1803 he was elected to the Senate, nominally as a Federalist, but his repeated displays of independence on such issues as the Louisiana Purchase and the embargo caused his party to compel his resignation

and ostracize him socially. In 1809 Madison rewarded him for his support of Jefferson by appointing him minister to St. Petersburg. He helped negotiate the Treaty of Ghent in 1814 and in 1815 became minister to London. In 1817 Monroe appointed him Secretary of State where he served with great distinction, gaining Florida from Spain without hostilities and playing an equal part with Monroe in formulating the Monroe Doctrine.

When no presidential candidate received a majority of electoral votes in 1824, Adams, with the support of Henry Clay, was elected by the House in 1825 over Andrew Jackson who had the original plurality. Adams had ambitious plans of government activity to foster internal improvements and promote the arts and sciences; but congressional obstructionism combined with his own unwillingness or inability to play the role of a politician meant that little was accomplished. Retiring to Quincy after his defeat in 1828, he was elected to the House of Representatives in 1831 where, though nominally a Whig, he pursued as ever an independent course. He led the fight to force Congress to receive anti-slavery petitions and fathered the Smithsonian Institution.

Stricken on the floor of the House, he died on February 23, 1848. Tactless, brusque, conscientious, a rough and savage debater, Adams spared neither himself nor his enemies. His long and detailed *Diary* gives a unique picture of the personalities and politics of the times. The standard biographies are by Morse and Clark.

ANDREW JACKSON

was born on March 15, 1767, in what is now generally agreed to be Waxhaw, South Carolina. After a turbulent boyhood as an orphan and a British prisoner, he moved west to Tennessee where he soon qualified for law practice but found time for such frontier pleasures as horse racing, cock-fighting and dueling. His marriage to Rachel Donelson Robards in 1791 was complicated by subsequent legal uncertainties about the status of her divorce. During the seventeen-nineties Jackson served in the Tennessee constitutional convention, the federal House of Representatives, the federal Senate and the Tennessee supreme court.

After some years as a country gentleman, living at the Hermitage near Nashville, Jackson in 1812 was given command of Tennessee troops sent against the Creeks. He defeated the Indians at Horseshoe Bend in 1814; subsequently he became a major general and won the Battle of New Orleans over veteran British troops though after the treaty of peace had been signed at Ghent. In 1818 General Jackson invaded Florida, captured Pensacola and hanged two Englishmen named Arbuthnot and

Ambrister, creating an international incident. A presidential boom began for him in 1821 and in its service he returned to the Senate (1823-25). Though he won a plurality of electoral votes in 1824, he lost in the House when Clay threw his strength to Adams; he won easily in 1828 by an electoral vote of 178 to 83.

As President, Jackson greatly expanded the power and prestige of the presidential office and carried through an unexampled program of domestic reform, vetoing the bill to extend the United States Bank, moving toward a hard-money currency policy and checking the program of federal internal improvements. He also vindicated federal authority against South Carolina with its doctrine of nullification and against France on the question of debts. The support given his policies by the workmen of the East as well as by the farmers of the East, West and South resulted in his triumphant re-election in 1832 over Clay by an electoral vote of 219 to 49, with 18 scattering and 2 not cast.

After watching the inauguration of his hand-picked successor, Martin Van Buren, Jackson retired to the Hermitage where he maintained a lively interest in national affairs until his death on June 8, 1845. A tall, dignified man with a drawn and wrinkled face, Jackson has been endowed by partisan historians with a violence and irascibility he appears not to have possessed. His great contribution was to adjust the presidential office and the democratic doctrines of Jefferson to the new situation created by the Industrial Revolution. The standard biographies are by James, Bassett and Parton.

MARTIN VAN BUREN

was born on December 5, 1782, at Kinderhook, New York. After graduating from the village school, he became a law clerk, entered practice in 1803 and soon became active in state politics as state senator and attorney general. In 1821 he was elected to the United States Senate. He threw the support of his efficient political organization, known as the Albany Regency, to William H. Crawford in 1824 and to Jackson in 1828. After leading the opposition to Adams' administration in the Senate, he served briefly as governor of New York and resigned to become Jackson's Secretary of State. He soon became on close personal terms with Jackson and played an important part in turning the Jacksonian program from the lines intended by his original Western backers.

In 1832 Van Buren became Vice President; in 1836, President, with an electoral vote of 170 against 124 scattered among four opponents. The Panic of 1837 overshadowed his term. He attributed it to

the overexpansion of the credit and favored the establishment of an independent treasury as repository for the federal funds. In 1840 he established a ten-hour day on public works. Defeated by Harrison in 1840, he was the leading contender for the Democratic nomination in 1844 until he publicly opposed immediate annexation of Texas and was subsequently beaten by the Southern delegations at the Baltimore convention. This incident increased his growing misgivings about the slave power.

After working behind the scenes among the antislavery Democrats, Van Buren joined in the movement which led to the Free-Soil party and became its candidate for President in 1848. He subsequently returned to the Democratic party while continuing to object to its pro-Southern policy. He died in Kinderhook on July 24, 1862. His *Autobiography* throws valuable sidelights on the political history of the times.

Small, erect, dapper, Van Buren had a reputation for slick politicking which won him such sobriquets as the Little Magician and the Red Fox of Kinderhook; but, as his later career showed, he was capable of taking firm and unpopular stands on public issues. His wife Hannah Hoes, whom he married in 1807, died in 1819.

The standard biographies are by Shepard and Lynch.

WILLIAM HENRY HARRISON

was born in Charles City County, Virginia, on February 9, 1773. Joining the army in 1791, he was active in Indian fighting in the Northwest, became secretary of the Northwest Territory in 1798 and governor of Indiana in 1800. He married Anna Symmes in 1795. Growing discontent over white encroachments on Indian lands led to the formation of an Indian alliance under Tecumseh to resist further aggressions. In 1811 Harrison won a nominal victory over the Indians at Tippecanoe and in 1813 a more decisive one at the Battle of the Thames, where Tecumseh was killed.

After resigning from the army in 1814, Harrison had an obscure career in politics and diplomacy, ending up in twenty years as a county recorder in Ohio. Nominated for President in 1835 as a military hero whom the conservative politicians hoped to be able to control, he ran surprisingly well against Van Buren in 1836. Four years later he defeated Van Buren by an electoral vote of 234 to 60 but caught pneumonia and died in Washington a month after his inauguration, April 4, 1841. Harrison's qualities were those of a soldier rather than of a statesman or political leader. The standard biographies are by Cleaves and Goebel.

JOHN TYLER

was born in Charles City County, Virginia, on March 29, 1790. A William and Mary graduate, he entered law practice and politics, serving in the House of Representatives (1816-21) and later as governor of Virginia (1825-27), and as senator. A thorough-going strict constructionist, he supported Crawford in 1824 and Jackson in 1828 but broke with Jackson over his Bank policy and became a member of the Southern state-rights group which co-operated with the Whigs. In 1836 he resigned from the Senate rather than follow instructions from the Virginia legislature to vote for a resolution expunging censure of Jackson from the Senate record.

Elected Vice President on the Whig ticket in 1840, Tyler succeeded to the presidency on Harrison's death. His strict-constructionist views soon caused a split with the Henry Clay wing of the Whig party and a stalemate on domestic questions. Tyler's more considerable achievements were his support of the Webster-Ashburton Treaty with Britain and his success in bringing about the annexation of Texas through joint congressional resolution.

After his presidency he lived in retirement in Virginia until the outbreak of the Civil War when he emerged briefly as chairman of a peace convention and then as delegate to the provisional Congress of the Confederacy. He died on January 18, 1862. He was married first to Letitia Christian March in 1813 and, two years after her death in 1842, to Julia Gardiner. Witty, amiable, courteous, Tyler was a Virginia gentleman whose presidency was hamstrung by the basic contradiction between his own ideas and those of the party which put him on the ticket as Vice President. The standard biographies are by Chitwood and Tyler.

JAMES KNOX POLK

was born in Mecklenburg County, North Carolina, on November 2, 1795. A graduate of the University of North Carolina, he moved west to Tennessee, was admitted to the bar and soon became prominent in state politics. In 1825 he was elected to the House of Representatives where he opposed Adams and, after 1829, became Jackson's floor leader in the fight against the Bank. In 1835 he became Speaker of the House. In 1839 he was elected governor of Tennessee but was beaten in tries for re-election in 1841 and 1843.

The supporters of Van Buren for the Democratic nomination in 1844 counted on Polk as his running mate; but, when Van Buren's stand on Texas alienated Southern support, the convention swung to Polk on the ninth ballot. He was elected over Henry Clay, the Whig candidate, by an

electoral vote of 170 to 105. Rapidly disillusioning those who thought that he would not run his own administration, Polk proceeded steadily and precisely to achieve four major objectives—the acquisition of California, the settlement of the Oregon question, the reduction of the tariff and the establishment of the independent treasury. He also enlarged the Monroe Doctrine to exclude all non-American intervention in American affairs, whether forcible or not, and he forced Mexico into a war which he waged to a successful conclusion. His wife Sarah Childress, whom he married in 1824, was a woman of charm and ability. Polk died in Nashville, Tennessee, on June 15, 1849.

Serious, hardworking, lacking in color, Polk has long been underrated by historians who mistakenly regarded him as a slaveholders' puppet; in fact, few presidents have so thoroughly controlled their own administration or have so ably accomplished the purposes they set for themselves. Polk's *Diary* reflects the mood and problems of his presidency. The standard biography is by McCormac.

ZACHARY TAYLOR

was born at Montebello, Orange County, Virginia, on November 24, 1784. Embarking on a military career in 1808, Taylor fought in the War of 1812, the Black Hawk War and the Seminole War, holding in between garrison jobs on the frontier or desk jobs in Washington. A brigadier general as a result of his victory over the Seminoles at Lake Okeechobee (1837), Taylor held a succession of Southwestern commands and in 1846 established a base on the Rio Grande, where his forces engaged in hostilities which precipitated the war with Mexico. He captured Monterrey in Sept., 1846, and, disregarding Polk's orders to stay on the defensive, defeated Santa Anna at Buena Vista in February, 1847, ending the war in the northern provinces.

Though Taylor had never cast a vote for President, his party affiliations were Whiggish, and his availability was increased by his difficulties with Polk. He was elected President over the Democrat Lewis Cass by an electoral vote of 163 to 127. During the revival of the slavery controversy, which was to result in the Compromise of 1850, Taylor began to take an increasingly firm stand against appeasing the South; but he died in Washington on July 9, 1850, in the midst of the fight over the Compromise. He married Margaret Mackall Smith in 1810. His bluff and simple soldierly qualities won him the name of Old Rough and Ready. During his brief term as President he displayed a growing insight into political questions. The standard biographies are by Hamilton and by Bent and McKinley.

MILLARD FILLMORE

was born at Locke, Cayuga County, New York, on January 7, 1800. A lawyer, he entered politics as an Antimason under the sponsorship of Thurlow Weed, editor and party boss, and subsequently followed Weed into the Whig party. He served in the House of Representatives (1833-35 and 1837-43) and played a leading role in writing the tariff of 1842. Defeated for governor of New York in 1844, he became comptroller in 1848, was put on the Whig ticket with Taylor as a concession to the Clay wing of the party and became President upon Taylor's death in 1850.

As President, Fillmore broke with Weed and William H. Seward and associated himself with the pro-Southern Whigs, supporting the Compromise of 1850. Defeated for the Whig nomination in 1852, he ran for President in 1856 as candidate of the American or Know-Nothing party, which sought to unite the country against foreigners in the alleged hope of diverting it from the explosive slavery issue. Fillmore opposed Lincoln during the Civil War. He died in Buffalo on March 8, 1874. He was married in 1826 to Abigail Powers, who died in 1853, and in 1858 to Caroline Carmichael McIntosh. Urbane, gracious, colorless and weak, Fillmore was an undistinguished President. The standard biography is by Griffiths.

FRANKLIN PIERCE

was born at Hillsboro, New Hampshire, on November 23, 1804. A Bowdoin graduate and lawyer, he won rapid political advancement in the Democratic party, in part because of the prestige of his father, Governor Benjamin Pierce. By 1831 he was Speaker of the New Hampshire House of Representatives; from 1833 to 1837 he served in the federal House and from 1837 to 1842 in the Senate. His wife, Jane Means Appleton, whom he had married in 1834, disliked Washington and the somewhat dissipated life led by Pierce; and in 1842 Pierce, resigning from the Senate, took up a successful law practice in Concord, New Hampshire.

During the Mexican War Pierce was a brigadier general. Thereafter he continued to oppose antislavery tendencies within the Democratic party. As a result, he was the Southern choice to break the deadlock at the Democratic convention of 1852 and was nominated on the 49th ballot. Pierce rolled up 254 electoral votes to 42 for Winfield Scott, the Whig candidate.

As President, Pierce followed a course of appeasing the South at home and of playing with schemes of territorial expansion abroad. The failure of both his foreign and domestic policies prevented his renomination; and he died in Concord, New Hampshire, on October 8, 1869, in relative ob-

scurity. A kindly and courteous person, Pierce was weak, unstable and lacking in presidential qualities. The standard biography is by Nichols.

JAMES BUCHANAN

was born near Mercersburg, Pennsylvania, on April 23, 1791. A Dickinson graduate and a lawyer, he entered Pennsylvania politics as a Federalist. With the disappearance of the Federalist party, he became a Jacksonian Democrat. He served with ability in the House (1821-31), as minister to St. Petersburg (1832-33) and in the Senate (1834-45), and in 1845 became Polk's Secretary of State. Disappointed in the presidential nomination in 1852, Buchanan became minister to Britain in 1853 where he participated with other American diplomats in Europe in drafting the expansionist Ostend Manifesto.

In 1856 Buchanan received the Democratic nomination and won the election, gaining 174 electoral votes to 114 for John C. Frémont, the Republican candidate, and 8 for Millard Fillmore, American party. The growing crisis over slavery presented Buchanan with problems he lacked the will to tackle. His appeasement of the South alienated the Stephen Douglas wing of the Democratic party without reducing Southern militancy on slavery issues. While denying the right of secession, Buchanan also denied that the federal government could do anything about it. He supported the administration during the Civil War and died in Lancaster, Pennsylvania, on June 1, 1868.

The only President to remain a bachelor throughout his term, Buchanan used his charming niece Harriet Lane as White House hostess. Legalistic, indecisive and timorous as President, Buchanan filled his other public offices capably. The standard biography is by Curtis.

ABRAHAM LINCOLN

was born in Hardin (now Larue) County, Kentucky, on February 12, 1809. His family moved to Indiana and then to Illinois, and Lincoln gained what education he could along the way. While reading law, he worked in a store, managed a mill, surveyed, and split rails. In 1834 he went to the state legislature as a Whig and became the party's floor leader. For the next twenty years he remained in law practice in Springfield, except for a single term (1847-49) in Congress where he denounced the Mexican War. In 1855 he was a candidate for senator and in 1856 he joined the new Republican party.

A leading but unsuccessful candidate for the vice-presidential nomination with Frémont, Lincoln gained national attention in 1858 when, as Republican candidate for

senator from Illinois, he engaged in a series of debates with Stephen A. Douglas, the Democratic candidate. He lost the senatorial election, but continued to prepare the way for the 1860 Republican convention and was rewarded with the presidential nomination on the third ballot. He polled 180 electoral votes, as against the 123 of his three opponents, but had only a plurality of the popular vote.

From the start, Lincoln made clear that, unlike Buchanan, he believed the national government had the power to crush the rebellion. Not an abolitionist, he held the slavery issue subordinate to that of preserving the Union but soon perceived that the war could not be brought to a successful conclusion without freeing the slaves. His administration was hampered by the incompetence of many Union generals, the inexperience of the troops and the harassing political tactics both of the Republican Radicals, who favored a hard policy toward the South, and the Democratic Copperheads, who desired a negotiated peace. The Gettysburg Address of November 19, 1863, marks the high point in the record of American eloquence. His patient search for a winning combination finally brought Generals Ulysses S. Grant and William T. Sherman to the top; and their series of victories in 1864 dispelled the mutterings from both Radicals and Peace Democrats which at one time seemed to threaten Lincoln's re-election. He received 212 electoral votes to 21 for George B. McClellan, the Democratic candidate. His inaugural address urged leniency toward the South: "With malice toward none, with charity for all . . . let us strive on to finish the work we are in; to bind up the nation's wounds . . ." This policy aroused growing opposition on the part of the Republican Radicals, but Lincoln was shot by John Wilkes Booth at Ford's Theater, Washington, on April 14, 1865, before the matter could be put to test. He died the following day.

Lincoln's marriage to Mary Todd in 1842 was often unhappy and turbulent, in part because of his wife's pronounced instability. By his remarkable literary artistry, his essential patience and devotion, his profound sense of the importance of government by, for and of the people, by the manner of his life and of his death, Lincoln has won a unique place in the hearts of Americans. The standard biographies are by Sandburg, Herndon, Nicolay and Hay.

ANDREW JOHNSON

was born at Raleigh, North Carolina, on December 29, 1808. Self-educated, he became a tailor in Greeneville, Tennessee, but soon went into politics where he rose steadily. From 1843 to 1853 he served in the House of Representatives, 1853-57 as governor of Tennessee and in 1857 was

elected Senator. Politically he was a Jacksonian Democrat, and his specialty was the fight for a more equitable land policy. Alone among the Southern Senators, he stood by the Union during the Civil War. In 1862 he became war governor of Tennessee and carried out a thankless and difficult job with great courage. Johnson became Lincoln's running mate in 1864 as result of an attempt to give the ticket a nonpartisan and nonsectional character. Succeeding to the presidency on Lincoln's death, Johnson sought to carry out his policy but without his political skill. The result was a hopeless conflict with the Radical Republicans who dominated Congress, passed measures over Johnson's vetoes and attempted to limit the power of the executive concerning appointments and removals. The conflict culminated with Johnson's impeachment for attempting to remove his disloyal Secretary of War in defiance of the Tenure of Office Act which required senatorial concurrence for such dismissals. The opposition failed by one vote to get the two-thirds necessary for conviction.

After his presidency, Johnson maintained an interest in politics and in 1875 was elected to the Senate. He died near Carter Station, Tennessee, on July 31, 1875. He married Eliza McCardle in 1827. An honest, courageous and intelligent man, Johnson lacked the tact, patience and self-control to be an effective President.

The standard biographies are by Winston, Stryker and Milton.

ULYSSES SIMPSON GRANT

was born (as Hiram Ulysses Grant) at Point Pleasant, Ohio, on April 27, 1822. He finished West Point in 1843 and served without particular distinction in the Mexican War. In 1848 he married Julia Dent. He resigned from the army in 1854, following warnings from his commanding officer about his drinking habits, and for the next six years held a wide variety of jobs in the Middle West. With the outbreak of the Civil War, he sought a command and soon, to his surprise, was made a brigadier general. His continuing successes in the western theaters, culminating in the capture of Vicksburg in 1863, brought him national fame and soon the command of all the Union armies. His dogged, implacable policy of concentrating on dividing and destroying the Confederate armies brought the war to an end in 1865. In 1866 he was made full general.

Grant's relations with Johnson grew steadily worse; and in 1868, as the Republican candidate for President, Grant was elected with 214 electoral votes to 80 for the Democrat Horatio Seymour. From the start Grant showed his unfitness for the office. His cabinet was weak, his do-

mestic policy was confused, many of his intimate associates were corrupt. The notable achievement in foreign affairs was the settlement of controversies with Great Britain in the Treaty of London (1871), negotiated by his able Secretary of State, Hamilton Fish.

Nominated for a second term, he defeated Horace Greeley, the Democratic and Liberal Republican candidate, 286 votes to 63. The Panic of 1873 created difficulties for his second term.

After retiring from office, Grant toured Europe for two years and returned in time to accede to a third-term boom, but was beaten in the convention of 1880. Illness and bad business judgment darkened his last years, but he worked steadily at the *Personal Memoirs* which were to be so successful when published after his death at Mount McGregor, near Saratoga, New York, on July 23, 1885. Inarticulate, taciturn, loyal to his friends, he was an able general who should never have accepted the presidency. The standard biographies are by Hesseltine and Woodward.

RUTHERFORD BIRCHARD HAYES

was born at Delaware, Ohio, on October 4, 1822. A graduate of Kenyon College and the Harvard Law School, he practiced law in Sandusky and then in Cincinnati, Ohio. In 1852 he married Lucy Webb. A Whig, he joined the Republican party in 1855. During the Civil War he rose to the rank of major general. He served in Congress from 1865 to 1867 and then confirmed a reputation for honesty and efficiency in two terms as governor of Ohio. His re-election as governor in 1875 made him the logical candidate for those Republicans who wished to stop James G. Blaine in 1876, and he was successfully nominated.

The result of the election was for some time in doubt and hinged upon disputed returns from South Carolina, Louisiana, Florida and Oregon. Samuel J. Tilden, the Democratic candidate, had the larger popular vote but was adjudged by the strictly partisan decisions of the Electoral Commission to have one less electoral vote, 185 to 184. The national acceptance of this result was due in part to the general understanding that Hayes would pursue a conciliatory policy toward the South. He withdrew the troops from the South, took a conservative position on financial and labor issues and urged civil service reform.

Hayes served only one term by his own wish and spent the rest of his life in various humanitarian endeavors. He died in Fremont, Ohio, on January 17, 1893. A hard-working, conscientious, sensible man, Hayes represented the best type of Republican of his day. The standard biographies are by Eckenrode and Williams.

JAMES ABRAM GARFIELD,

the last President to be born in a log cabin, was born at Cuyahoga County, Ohio, on November 19, 1831. A Williams graduate, he taught school for a time and entered Republican politics in Ohio. In 1858 he married Lucretia Rudolph. During the Civil War he had a promising career, rising to the rank of major general of volunteers; but in 1863 he was elected to the House of Representatives where he served until 1880. His oratorical and parliamentary abilities soon made him the leading Republican in the House, though his record was marred by his unorthodox acceptance of a fee in the DeGolyer paving contract case and by suspicions of his complicity in the Crédit Mobilier scandal.

In 1880 Garfield was elected to the Senate, but instead became the presidential candidate on the 36th ballot as a result of a deadlock in the Republican convention. He gained 214 electoral votes to 155 for General Winfield Scott Hancock, the Democratic candidate. Garfield's administration was barely under way when he was shot by Charles J. Guiteau, a disappointed office seeker, in July. He died in Elberon, New Jersey, on September 19, 1881. An attractive and eloquent man, he was much beloved in his day.

The standard biographies are by Smith and Caldwell.

CHESTER ALAN ARTHUR

was born at Fairfield, Vermont, on October 5, 1830. A graduate of Union College, he became a successful New York lawyer. In 1859 he married Ellen Herndon. During the Civil War he held administrative jobs in the Republican state administration and in 1871 was appointed collector of the Port of New York by Grant. This post gave him control over considerable patronage; and, though not personally corrupt, Arthur managed his power in the interests of the New York machine so openly that President Hayes in 1877 called for an investigation, and in 1878 Arthur was suspended from his responsibilities.

In 1880 Arthur was nominated for Vice President in the hope of conciliating the followers of Grant and the powerful New York machine. As President on Garfield's assassination, Arthur, stepping out of his familiar role as spoilsman, backed civil service reform, reorganized the cabinet and prosecuted political associates accused of post office graft. Losing machine support and failing to gain the reformers, he was not renominated. He died in New York City on November 18, 1886. A tall, handsome, dignified man with real administrative abilities, he was a better President than his previous record promised. The standard biography is by Howe.

STEPHEN GROVER CLEVELAND

was born at Caldwell, New Jersey, on March 18, 1837. He was admitted to the bar in Buffalo, New York, in 1859 and lived there as a lawyer, with occasional incursions into Democratic politics, for more than twenty years. He did not participate in the Civil War. As mayor of Buffalo in 1881, he carried through a reform program so ably that the Democrats ran him successfully for governor in 1882. In 1884 he won the Democratic nomination for President. The campaign contrasted Cleveland's spotless public career with the uncertain record of James G. Blaine, the Republican candidate, and Cleveland received enough Mugwump (Independent Republican) support to win by 219 to 182 electoral votes.

As President, Cleveland pushed civil service reform, opposed the pension grab and attacked the high tariff rates. While in the White House he married Frances Folsom (1886). Renominated in 1888, Cleveland was defeated by Benjamin Harrison, polling more popular but fewer electoral votes. In 1892 he was re-elected over Harrison, 277 to 145, with 22 votes for James B. Weaver, the Populist candidate. When the Panic of 1893 burst upon the country, Cleveland's attempts to solve it by sound-money measures alienated the free-silver wing of the party, while his tariff policy alienated the protectionists. In 1894 he sent troops to break the Pullman strike. In foreign affairs his firmness caused Great Britain to back down in the Venezuela border dispute.

In his last years Cleveland was an active and much respected public figure. He died in Princeton, New Jersey, on June 24, 1908. An honest, stubborn, high-principled man, Cleveland was an old-fashioned liberal in the nineteenth-century sense who was baffled by the new problems of industrial society. The standard biographies are by Nevins and McElroy.

BENJAMIN HARRISON

was born in North Bend, Ohio, on August 20, 1833, the grandson of William Henry Harrison. A graduate of Miami University, he took up the law in Indiana and became active in Republican politics. In 1853 he married Caroline Lavinia Scott. During the Civil War he rose to the rank of brigadier general. A sound-money Republican, he was elected senator from Indiana in 1880 and in 1888 received the Republican nomination for President on the 8th ballot. Though behind on the popular vote, he won over Grover Cleveland in the electoral college by 233 to 168.

As President, Benjamin Harrison failed to please either the bosses or the reform element in the party. In foreign affairs he backed Secretary of State Blaine whose policy foreshadowed later American im-

perialism. In 1892 Harrison was renominated, but Cleveland beat him in the election. His wife died in the White House in 1892, and Harrison married her niece, Mary Scott (Lord) Dimmick, in 1896. After his presidency, he resumed law practice. He died in Indianapolis, Indiana, on March 13, 1901. Harrison was an honest man of very medium abilities.

WILLIAM MCKINLEY

was born in Niles, Ohio, on January 29, 1843. A graduate of Allegheny College, he rose from the ranks to become a major in the Civil War. Subsequently he opened a law office in Canton, Ohio, and in 1871 married Ida Saxton. Elected to Congress in 1876, he served there steadily till 1891, except for 1883-85. His faithful advocacy of business interests culminated in the passage of the highly protective McKinley Tariff of 1890. With the support of Mark Hanna, a shrewd Cleveland businessman interested in safeguarding tariff protection, McKinley became governor of Ohio in 1892 and Republican presidential candidate in 1896. The business community, alarmed by the progressivism of William Jennings Bryan, the Democratic candidate, spent considerable money to assure McKinley's victory which was by the margin of 271 to 176 in the electoral college.

The chief event of McKinley's administration was the war with Spain which resulted in our acquisition of the Philippines and other islands. With imperialism as an issue, McKinley defeated Bryan again in the election of 1900 by 292 to 155. On September 6, 1901, he was shot at Buffalo by Leon F. Czolgosz, an anarchist, and he died there on September 14.

The standard biography is by Olcott.

THEODORE ROOSEVELT

was born in New York City on October 27, 1858. A Harvard graduate, he was early interested in ranching, in politics and in writing picturesque historical narratives. He was a Republican member of the New York Assembly in 1882-84, an unsuccessful candidate for mayor of New York in 1886, a U. S. Civil Service Commissioner under Harrison, Police Commissioner of New York City in 1895 and Assistant Secretary of the Navy under McKinley in 1897. After exuding a belligerence which helped bring on the war with Spain, he resigned in 1898 to help organize a volunteer regiment named the Rough Riders and take a more direct part in the war. Always publicity-shrewd, he won the New York gubernatorial nomination in 1898 in spite of pronounced lack of enthusiasm on the part of the bosses.

After two years of T.R. in Albany, the New York bosses succeeded in getting him the vice-presidential nomination in 1900.

Roosevelt accepted it with reluctance, feeling that his career had been ruined. As President on McKinley's assassination, he perceived the new popular mood of progressivism and initiated a policy of trust busting, designed to control giant corporations. He also strengthened government powers over interstate commerce and launched a conservation program to save natural resources. In foreign affairs he pursued a truculent policy, permitting the instigation of a revolt in Panamá to dispose of Colombian objections to the Panama Canal and helping to maintain the balance of power in the East by bringing the Russo-Japanese war to an end. In 1904 he decisively defeated Alton B. Parker, his conservative Democratic opponent, by an electoral margin of 336 to 140.

Following his second term he went big-game hunting in Africa and toured Europe. On his return to the United States, his increasing coldness toward Taft led him to overlook his earlier disclaimer of third-term ambitions and to re-enter politics. Defeated by the machine in the Republican convention of 1912, he organized the Progressive party and polled more votes than Taft, though the split brought about the election of Wilson. From 1915 on, Roosevelt strongly favored intervention in the European war. He became deeply embittered at Wilson's refusal to allow him to raise a volunteer division. He died in Oyster Bay, New York, on January 6, 1919. He was married twice: in 1880 to Alice Hathaway Lee, who died in 1884; and in 1886 to Edith Kermit Carow.

The athletic advocate of the strenuous life, with his high voice, prominent teeth and thick glasses, Roosevelt captured the imagination of the American people. He was one of the great personalities of American history. The standard biography is by Pringle.

WILLIAM HOWARD TAFT

was born in Cincinnati, Ohio, on September 15, 1857. A Yale graduate, he entered Ohio Republican politics in the eighteen eighties. In 1886 he married Helen Herron. From 1887 to 1890, he served on the Ohio superior court; 1890-92, as solicitor general of the United States; 1892-1900, on the federal circuit court. In 1900 McKinley appointed him president of the Philippine Commission and in 1901 governor general. Taft had great success in pacifying the Filipinos, solving the problem of the church lands, improving economic conditions and establishing limited self-government. His period as Secretary of War 1904-08 further demonstrated his capacity as administrator and conciliator; and he was Roosevelt's hand-picked successor in 1908.

In the election he polled 321 electoral votes to 162 for William Jennings Bryan.

As President, though he carried on many of Roosevelt's policies, Taft got into increasing trouble with the progressive wing of the party and displayed mounting irritability and indecision. After his defeat in 1912, he became professor of constitutional law at Yale. In 1921 he was appointed Chief Justice of the United States. He died in Washington on March 8, 1930. Enormously large, deliberate and good-humored, Taft excelled as an administrator and judge, not as a political leader.

The standard biography is by Pringle.

THOMAS WOODROW WILSON

was born in Staunton, Virginia, on December 28, 1856. A Princeton graduate, he turned from law practice to post-graduate work in political science at Johns Hopkins University, receiving his Ph.D. in 1886. He taught at Bryn Mawr, Wesleyan and Princeton, and in 1902 was made president of Princeton. After an unsuccessful attempt to democratize the social life of Princeton, he welcomed an invitation in 1910 to be the Democratic gubernatorial candidate in New Jersey. His success in fighting the machine and putting through a reform program attracted national attention.

In 1912, after a protracted contest at Baltimore, Wilson won the Democratic nomination on the 46th ballot. In the election he received 435 electoral votes to 88 for Roosevelt and 8 for Taft. During his first term Wilson proceeded under the standard of the New Freedom to enact a program of domestic reform, including the Federal Reserve Act, the Clayton Anti-trust Act, the establishment of the Federal Trade Commission and other measures designed to restore competition in the face of the great monopolies. In foreign affairs, while privately sympathetic with the Allies, he strove to maintain strict neutrality in the European war and warned both sides against encroachments on American interests.

Re-elected in 1916 as a peace candidate, he tried to mediate between the warring nations; but, when the Germans resumed unrestricted submarine warfare in 1917, Wilson brought the United States into what he now believed was a war to make the world safe for democracy. He supplied the classic formulations of Allied war aims; and the armistice of November, 1918, was negotiated on the basis of Wilson's Fourteen Points. In 1919 he strove at Versailles to lay the foundations for enduring peace. He accepted the imperfections of the Versailles Treaty in the expectation that they could be remedied by action within the

League of Nations. He probably could have secured ratification of the treaty if he had adopted a more conciliatory attitude toward the mild reservationists; but his insistence on all or nothing eventually caused the diehard isolationists and diehard Wilsonites to unite in rejecting a compromise.

In September, 1919, Wilson suffered a paralytic stroke which limited his future activity. After the presidency he lived on in retirement in Washington, dying February 3, 1924. He was married twice—in 1885 to Ellen Louise Axson, who died in 1914, and in 1915 to Edith Bolling Galt. A man of high principle, inspiring eloquence and great intellectual ability, Wilson was the first leader to fire the imagination of the masses of the world with the vision of world peace. The standard biography is by Baker.

WARREN GAMALIEL HARDING

was born in Morrow County, Ohio, on November 2, 1865. After attending Ohio Central College, Harding became interested in journalism and in 1884 bought the *Marion (Ohio) Star*. In 1891 he married a wealthy widow, Florence Kling De Wolfe. As his paper prospered, he entered Republican politics, serving as state senator (1899–1903), and as lieutenant governor (1904–06). In 1910 he was defeated for governor but in 1914 was elected to the Senate. His reputation as orator made him keynoter in the 1916 convention.

When the 1920 Republican convention was deadlocked between Leonard Wood and Frank O. Lowden, Harding was made the dark-horse nominee on his solemn affirmation that there was no reason in his past that he should not be. Straddling the League question, Harding was elected easily, with 404 electoral votes to 127 for James M. Cox, his Democratic opponent. His cabinet contained some able men, but also some manifestly unfit for public office. Harding's own intimates were mediocre when they were not corrupt. The impending disclosure of scandals in the Interior and Justice departments and in the Veterans' Bureau, as well as political setbacks, profoundly worried him. On his return from Alaska in 1923, he died suddenly at San Francisco on August 2. A handsome and genial man, indiscriminating in his associates, lacking in political ideas or fortitude, Harding was totally unfitted for the presidency.

JOHN CALVIN COOLIDGE

was born in Plymouth, Vermont, on July 4, 1872. An Amherst graduate, he went into law practice at Northampton, Massachusetts, in 1897. He married Grace Anna Goodhue in 1905. He entered Republican

state politics, becoming successively mayor of Northampton, state senator, lieutenant governor and, in 1919, governor. His conduct in regard to the Boston police strike in 1919 won him a somewhat undeserved reputation for decisive action and brought him the Republican vice-presidential nomination in 1920. After Harding's death Coolidge handled the Washington scandals with care and finally managed to save the Republican party from public blame for the widespread corruption.

In 1924 Coolidge won re-election without difficulty, getting 382 electoral votes to 136 for the Democrat, John W. Davis, and 13 for Robert M. La Follette running on the Progressive ticket. His second term, like his first, was characterized by a general satisfaction with the existing economic order. He stated that he did not choose to run in 1928.

After his presidency, Coolidge lived quietly in Northampton, writing an unilluminating *Autobiography* and conducting a syndicated column. He died in Northampton, Massachusetts, on January 5, 1933. His dry, Yankee humor, his frugality and glumness made him a paradoxically popular President in the boom period. The standard biographies are by White and Fuess.

HERBERT CLARK HOOVER

was born at West Branch, Iowa, an August 10, 1874. A Stanford graduate, he worked from 1895 to 1913 as a mining engineer and consultant in North America, Europe, Asia, Africa and Australia. In 1899 he married Lou Henry. During the First World War he served with distinction as chairman of the American Relief Committee in London, as chairman of the Commission for Relief in Belgium and as United States Food Administrator. His political affiliations were still sufficiently indeterminate for him to be mentioned as a possibility for both Republican and Democratic nominations in 1920; but after the election he served both Harding and Coolidge as Secretary of Commerce.

In the election of 1928 Hoover received 444 electoral votes to 87 for Alfred E. Smith, the Democratic candidate. He soon faced the worst depression in the nation's history; but his attacks upon it were hampered by his devotion to the theory that the forces which brought the crisis would soon bring the revival, and then by his belief that in too many areas the federal government had no power to act. In a succession of vetoes he struck down measures proposing a national employment system or national relief; he reduced income tax rates; and only at the end of his term did he yield to popular pressure and set up agencies such as the Reconstruction Finance Corporation to make emergency loans to assist business.

After his 1932 defeat, Hoover returned to private business. In 1946, President Truman charged him with various world food missions; and from 1947 to 1949 and again from 1953 to 1955, he was head of the Commission on Organization of the Executive Branch of the Government.

FRANKLIN DELANO ROOSEVELT

was born in Hyde Park, New York, on January 30, 1882. A Harvard graduate, he attended Columbia Law School and was admitted to the New York bar. In 1910 he was elected to the New York state senate as a Democrat. Re-elected in 1912, he was appointed Assistant Secretary of the Navy by Woodrow Wilson in 1913. In 1920 his radiant personality and his war services resulted in his nomination for Vice President as James M. Cox's running mate. After his defeat, he returned to law practice in New York. In August, 1921, Roosevelt was stricken with infantile paralysis while at Campobello, New Brunswick. After a long and gallant fight against the disease he recovered partial use of his legs. In 1924 and 1928 he led the fight at the Democratic national conventions for the nomination of Governor Alfred E. Smith of New York; and in 1928 Roosevelt was himself induced to run for governor of New York. He was elected and was re-elected in 1930.

In 1932 Roosevelt received the Democratic nomination for President and immediately launched a campaign which brought new spirit to a weary and discouraged nation. He won the election over Herbert Hoover by a margin of 472 to 59 in the electoral college. His first term was characterized by an unfolding of the New Deal program, with greater benefits for labor, the farmers and the unemployed, and the progressive estrangement of most of the business community.

At an early stage Roosevelt became aware of the menace to world peace involved in the existence of totalitarian fascism, and from 1937 on he tried to focus public attention on the trend of events in Europe and Asia. As a result he was widely denounced as a warmonger. He was re-elected in 1936 over Alfred M. Landon by the overwhelming electoral margin of 523 to 8; and the gathering international crisis caused him to decide to run again in 1940. He defeated Wendell L. Willkie by a vote of 449 to 82.

Roosevelt's program to bring maximum aid to Britain and, after June, 1941, to Russia was opposed, until the Japanese attack on Pearl Harbor restored national unity. During the war Roosevelt shelved the New Deal in the interests of conciliating the business community, both in order to get full production during the war and to prepare the way for a united

acceptance of the peace settlements after the war. A series of conferences with Winston Churchill and Joseph Stalin laid down the bases for the postwar world. In 1944 he was elected to a fourth term, running against Governor Thomas E. Dewey of New York.

On April 12, 1945, Roosevelt died at Warm Springs, Georgia, shortly after his return from the Yalta Conference. His wife, Anna Eleanor Roosevelt, whom he married in 1905, is a woman of great ability who made significant contributions to her husband's policies. No President has been faced with so many staggering responsibilities, both at home and abroad.

HARRY S. TRUMAN

was born on a farm near Lamar, Missouri, on May 8, 1884. During the First World War he served in France with the 129th Field Artillery. He married Bess Wallace in 1919. After engaging briefly and unsuccessfully in the haberdashery business in Kansas City, Truman entered local politics. Under the sponsorship of Thomas Pendergast, Democratic boss of Missouri, he held a number of local offices, preserving his personal honesty in the midst of a notoriously corrupt political machine. In 1934 he was elected to the Senate and was re-elected in 1940. During his first term he was a loyal but quiet supporter of the New Deal; but in the course of his second term, an appointment as head of a Senate committee to investigate war production brought out his special qualities of honesty, common sense and hard work, and he won widespread respect.

Elected Vice President in 1944, Truman became President upon Roosevelt's death in 1945 and immediately had to face complex postwar problems, both domestic and foreign. His first attempts did not meet with marked success, and the Republicans won control of Congress in 1946. The next two years were distinguished by the Truman Doctrine, the Marshall Plan and civil-rights proposals; and his general record, highlighted by a vigorous Fair Deal campaign, brought about his unexpected and impressive re-election in 1948.

Truman's second term was primarily concerned with the Cold War with the Soviet Union, the implementing of the North Atlantic Pact, the United Nations police action in Korea, and the vast rearmament program with its accompanying problems of economic stabilization.

On Mar. 29, 1952, Truman announced that he would not run again for the Presidency. He campaigned actively for Adlai E. Stevenson. After Eisenhower's inauguration, Truman returned to his Independence, Missouri, home to write his memoirs. He further busied himself with the organization of the Harry S. Truman Library in Independence, Missouri.

DWIGHT DAVID EISENHOWER

was born in Denison, Texas, on October 14, 1890. His ancestors lived in Germany, and emigrated to America, settling in Pennsylvania, early in the 18th century. His father, David, had a general store in Hope, Kansas, which failed. After a brief time in Texas, the family moved to Abilene, Kansas.

After graduating from Abilene High School in 1909, Dwight Eisenhower did odd jobs for almost two years. He won an appointment to the Naval Academy at Annapolis, but it turned out that he was too old for admittance. Then he received an appointment in 1910 to West Point. He was graduated a 2nd lieutenant in 1915.

He did not see service in World War I, having been assigned to the 19th Infantry at Fort Sam Houston, Texas. There he met Mamie Geneva Doud, whom he married in Denver on July 1, 1916. Their first son died in infancy. Their second son is Major John Sheldon Doud Eisenhower.

A paper he wrote about 1930 attracted the attention of General Douglas MacArthur, then Chief of Staff, who asked that Eisenhower be assigned to his office. When MacArthur went to the Philippines as military adviser in 1935, Eisenhower accompanied him and remained with him until 1939.

General George C. Marshall brought him into the War Department General Staff and, in 1942, put him in command of the

Allied invasion of North Africa. In 1944, Eisenhower was made Supreme Allied Commander of the invasion of Europe.

After the war, Eisenhower served as Army Chief of Staff from November 1945 until February 1948, when he was appointed president of Columbia University.

In December 1950, President Truman recalled Eisenhower to active duty to command the North Atlantic Treaty Organization forces in Europe. He held this post until the end of May 1952.

In the Republican Convention of July 1952 in Chicago, Eisenhower won the Presidential nomination on the first ballot in a close race with Senator Robert A. Taft of Ohio. In November, he won the election, defeating Adlai E. Stevenson by an electoral vote of 442 to 89.

Eisenhower's Administration from 1952 to the fall of 1956 was marked by alternating periods of tension and relaxation in foreign affairs. On the home front, following a middle-of-the-road line, he did little to abandon the social policies of the New Deal-Fair Deal, but he sought wider state participation and the assumption of a larger responsibility by business for investment and employment. His illnesses in Sept. 1955 and June 1956 raised the question of his availability for a second term. He announced his candidacy on July 10, and was renominated. He was re-elected by a total of 457 electoral votes to 73 for Adlai E. Stevenson.

For later information, see Headline Stories of 1957.

How to Number the Presidents

Did Eisenhower take office as the 33rd President or as the 34th?

The difficulty started with Grover Cleveland. He became our 22nd President back in 1885. Then came Benjamin Harrison, who was obviously the 23rd President, serving from 1889-93. At this point, Cleveland returned to the White House for a second (but nonconsecutive) term.

Cleveland was still the same man who had been our 22nd President. But in his later term, it would look silly—some folks thought—to continue to call him our 22nd President. That would make the 22nd President follow the 23rd. Numbers should go in order—so ran the argument—and Cleveland should therefore be designated both as the 22nd President in his first term and as the 24th in his second term.

The people who argued the other way found an eloquent spokesman in John Kieran. He said: "Write down the names of all the Presidents, and you will only get 33. If you write Cleveland twice, you'll get 34—but in that case you've got

to write Franklin D. Roosevelt's name four times. Until they prove to me that Grover Cleveland was two men, Eisenhower can't be the 34th President."

The *Congressional Directory*, which must be considered the official final authority, grappled with the problem of numbering the Presidents. Until recent years, it has followed John Kieran's theory.

After the election of President Truman, and before the election of President Eisenhower, the *Congressional Directory* changed its official mind. In the 1956 *Congressional Directory*, Truman is the 33rd President, and Eisenhower is listed as the 34th. (Cleveland has two numbers—22nd and 24th.)

The 1957 *Congressional Directory* lists Presidents without numbering them—we don't know why. Although we are listing the Presidents on the basis of the *Congressional Directory* of 1956 we can't help thinking of John Kieran's remark: "Put the busts of all the Presidents in a row and count them and you will get 33, and only 33."

Annual Salaries of Federal Officials

Source: U. S. Department of the Treasury

President of the U. S.	\$100,000 ¹	Secretaries of the Army, Navy, Air Force.....	22,000
Vice President of the U. S.	35,000 ²	Senators and Representatives.....	22,500
Cabinet members.....	25,000	Speaker of the House.....	35,000 ²
Undersecretaries of executive departments.....	21,000 ³	Chief Justice of the Supreme Court.....	35,500
Deputy Secretary of Defense.....	22,500	Associate Justices of the Supreme Court.....	35,000

¹ Plus taxable \$50,000 for expenses and a nontaxable sum (not to exceed \$40,000 a year) for traveling and official entertainment expenses. ² Plus taxable \$10,000 for expenses. ³ Except Undersecretary of State, who receives \$22,500.
NOTE: All salaries shown above are taxable.

Footnotes for Table on Preceding Page

¹ F—Federalist; DR—Democratic-Republican; D—Democratic; W—Whig; R—Republican; U—Union. ² Same party as President, except as indicated. ³ No party for first election. The party system in the U. S. made its appearance during Washington's first term. ⁴ Democratic-Republican. ⁵ Died in office Apr. 20, 1812. ⁶ Died in office Nov. 23, 1814. ⁷ Resigned Dec. 28, 1832, to become U. S. Senator. ⁸ Died in office. ⁹ Died in office Apr. 18, 1853. ¹⁰ Died in office (shot Apr. 14 by John Wilkes Booth). ¹¹ Died in office Nov. 22, 1875. ¹² Died in office (shot July 2 by Charles J. Guiteau). ¹³ Died in office Nov. 25, 1885. ¹⁴ Died in office (shot Sept. 6 by Leon F. Czolgosz). ¹⁵ Died in office Nov. 21, 1890. ¹⁶ Died in office Oct. 30, 1912. ¹⁷ The Republican National Convention of 1864 adopted the name Union party. It renominated Lincoln for President; for Vice President it nominated Johnson, a War Democrat. Although frequently listed as a Republican Vice President and President, Johnson undoubtedly considered himself strictly a member of the Union party. When that party broke apart after 1868, he returned to the Democratic party. ¹⁸ Johnson was not a professed church member; however, he admired the Baptist principles of church government.

CONGRESS OF THE UNITED STATES

THE HOUSE OF REPRESENTATIVES

The apportionment based on the Seventeenth Census (1950) distributes the 435 seats in the House among the states according to the method of equal proportions. By this method the per cent difference between the average number of Representatives per million people in any 2 states is made as small as possible. Also, the per cent difference between the average districts, i.e., the average number of persons per Representative, in any 2 states is made as small as possible. By equalizing the representation of all pairs of states, the method gives as nearly equal representation as possible to all states in proportion to their population.

The numerals indicate the Congressional Districts of the states, and the designation At-L means At-Large. An asterisk (*) indicates that the Congressman was returned to office in the 1956 elections. The terms of all Representatives end January, 1959.

Executive Departments and Agencies

Source: U.S. Government Manual

(Unless otherwise indicated, addresses shown are in Washington, D.C.; officials listed are as of Sept. 1957.)

Executive Office of the President THE WHITE HOUSE OFFICE

1600 Pennsylvania Ave., NW.

The Assistant to the President: Sherman Adams.

The Deputy Assistant to the President: Wilton B. Persons.

Secretary to the President: Bernard M. Shanley.

Press Secretary to the President: James C. Hagerty.

Special Counsel to the President: Gerald D. Morgan.

Special Assistant to the President: Harold E. Stassen.*

*On White House payroll, but reports directly to Secy. of State.

Activities: Serves President in performance of activities incident to his office.

BUREAU OF THE BUDGET

Executive Office Bldg.

Established: June 10, 1921.

Director: Percival F. Brundage.

Activities: Assists President in preparing budget and formulating fiscal program; supervises administration of budget; coordinates advice on proposed legislation; plans improvements in statistical services; keeps President informed of progress of activities by government agencies so that Congressional appropriations are spent most economically.

NATIONAL SECURITY COUNCIL (NSC)

Executive Office Bldg.

Members: 5. *Established:* July 26, 1947.

Chairman: Dwight D. Eisenhower, President of the U. S.

Other members: Richard M. Nixon, Vice President of the U. S.; John Foster Dulles, Secretary of State; Neil H. McElroy, Secretary of Defense; Gordon Gray, Director of Office of Defense Mobilization.

Director of Central Intelligence Agency: Allen W. Dulles.

Chairman of Operations Coordinating Board: Christian A. Herter.

Activities: Assesses and appraises objectives, commitments and risks of U. S. in relation to our actual and potential military power in interests of national security. Central Intelligence Agency advises NSC on all intelligence matters. Operations Coordinating Board provides for integrated implementation of national security policies.

COUNCIL OF ECONOMIC ADVISERS (CEA)

Executive Office Bldg.

Members: 3. *Established:* Feb. 20, 1946.

Chairman: Raymond J. Saulnier.

Other members: Joseph S. Davis, Paul W. McCracken.

Activities: Assists President in preparation of economic reports to Congress; studies economic trends; appraises government activities on nation's economy; recommends economic policies.

OFFICE OF DEFENSE MOBILIZATION (ODM)

Executive Office Bldg.

Established: 1953.

Director: Gordon Gray.

Activities: Advises President on co-ordination of military, industrial and civilian mobilization.

Executive Departments

DEPARTMENT OF STATE

21st St. & Virginia Ave., NW.

Established: 1781 as Department of Foreign Affairs; reconstituted, 1789, following adoption of Constitution; name changed to Department of State Sept. 15, 1789.

Secretary: John Foster Dulles.

Under Secretary: Christian A. Herter.

Activities: Determines government policy in relation to international problems; formulates measures for promoting friendship with other countries; develops policies and programs for U. S. participation in U. N. and other international organizations; conducts correspondence with our representatives abroad and with accredited foreign representatives here.

DEPARTMENT OF THE TREASURY

15th St. & Pennsylvania Ave., NW.

Established: Sept. 2, 1789.

Secretary: Robert B. Anderson.

Under Secretary: Fred C. Scribner, Jr.

Activities: Manages national finances; grants warrants for money drawn from Treasury pursuant to legal appropriations; handles collection of revenue; keeps and renders public accounts; prepares plans for improvement of revenue and for support of public credit; reports annually to Congress on condition of public finances; controls coinage and printing of money; administers Coast Guard, Bureau of Narcotics and Secret Service.

DEPARTMENT OF DEFENSE

The Pentagon

Established: July 26, 1947, as National Military Establishment; name changed to Department of Defense on Aug. 10, 1949. Subordinate to Secretary of Defense are Secretaries of Army, Navy, Air Force.

Secretary: Neil H. McElroy.

Deputy Secretary: Donald A. Quarles.

Secretary of the Army: Wilber M. Brucker.

Secretary of the Navy: Thomas S. Gates, Jr.

Commandant, Marine Corps: Gen. Randolph McC. Pate.

Secretary of the Air Force: James H. Douglas.

*Joint Chiefs of Staff:** Gen. Nathan F. Twining, chairman; Gen. Maxwell D. Taylor, Army; Adm. Arleigh A. Burke, Navy; Gen. Thomas O. White, Air Force; Gen. Randolph McC. Pate, Marine Corps (on Marine Corps matters only).

Activities: Provides for security of U. S. by establishing integrated policies and procedures; co-ordinates and directs the activities of 3 separately administered military departments (Army, Navy, Air Force).

DEPARTMENT OF JUSTICE

Constitution Ave. & 10th St., NW.

Established: Office of Attorney General was created Sept. 24, 1789. Although he was one of original Cabinet members, he was not executive department head until June 22, 1870, when Department of Justice was established.

Attorney General: Herbert Brownell, Jr.

Deputy Attorney General: William P. Rogers.

Director of FBI: J. Edgar Hoover.

Activities: Provides means for enforcing Federal laws; investigates and detects violations; represents U. S. in legal matters generally and gives advice and opinions when requested by President or heads of executive departments; directs FBI, Bureau of Prisons, Immigration and Naturalization Service.

POST OFFICE DEPARTMENT

12th St. & Pennsylvania Ave., NW.

Established: Office of Postmaster General and temporary post office system created Sept. 22, 1789. Act of Feb. 20, 1792, made detailed provisions for Post Office Department. Postmaster General became Cabinet member in 1829. Department received executive status June 8, 1872.

Postmaster General: Arthur E. Summerfield.

Deputy Postmaster General: Maurice H. Stans.

Activities: Maintains Postal Service of U. S. and executes all laws relative to it; negotiates, subject to approval of President, postal treaties with foreign governments.

DEPARTMENT OF THE INTERIOR

C St. between 18th & 19th Sts., NW.

Established: Mar. 3, 1849.

Secretary: Fred A. Seaton.

Under Secretary: Hatfield Chilson.

Activities: Develops and conserves natural resources of U. S. and territories; supervises public business relating to such offices as Bureau of Land Management, Bureau of Reclamation, Geological Survey, Bureau of Indian Affairs, National Park Service, Bureau of Mines, Fish and Wildlife Service, Office of Territories, etc.

* Consisting of a chairman and the chiefs of each service.

DEPARTMENT OF AGRICULTURE

14th St. & Independence Ave., SW.

Established: May 15, 1862. Administered by Commissioner of Agriculture until Feb. 9, 1889, when it was made executive department and office of Secretary was created.

Secretary: Ezra Taft Benson.

Under Secretary: True D. Morse.

Activities: Conducts comprehensive research and educational program relating to agriculture; provides crop reports, commodity standards, meat inspection and other marketing services; administers national forests; aids in flood control; administers price-support and production-adjustment programs; makes loans to farmers.

DEPARTMENT OF COMMERCE

14th St. & Constitution Ave., NW.

Established: Department of Commerce and Labor was created Feb. 14, 1903. On Mar. 4, 1913, all labor activities were transferred out of Department of Commerce and Labor and it was renamed Department of Commerce.

Secretary: Sinclair Weeks.

Under Secretary: Walter Williams.

Activities: Fosters and develops foreign and domestic commerce of U. S.; maintains Bureau of the Census, Office of Business Economics, Civil Aeronautics Administration, Coast and Geodetic Survey, Maritime Administration, Patent Office, Bureau of Public Roads, National Bureau of Standards, Weather Bureau, etc.

DEPARTMENT OF LABOR

14th St. & Constitution Ave., NW.

Established: Bureau of Labor was created in 1884 under Department of the Interior; later became independent department without executive rank. Returned to bureau status in Department of Commerce and Labor, but on Mar. 4, 1913, became independent executive department under its present name.

Secretary: James P. Mitchell.

Under Secretary: James T. O'Connell.

Activities: Promotes welfare of wage earners of U. S., improving their working conditions and advancing their opportunities for profitable employment; directs collection and collation of statistics concerning labor conditions; promulgates and enforces certain maximum-hour, minimum-wage, child-labor, safety and health standards.

DEPARTMENT OF HEALTH, EDUCATION AND WELFARE

330 Independence Ave., SW.

Established: Apr. 11, 1953, replacing Federal Security Agency, which was created Apr. 25, 1939.

Secretary: Marion B. Folsom.

Under Secretary: John A. Perkins.

Activities: Supervises and co-ordinates various organizations within the department. Organizations are: Food and Drug Administration, Office of Education, Office of Vocational Rehabilitation, Public Health Service, St. Elizabeths Hospital, Social Security Administration; also following Federally supported corporations: American Printing House for the Blind, Gallaudet College and Howard University.

Independent Agencies

(Because of space limitations, only agencies of interest to the general public are listed here.)

Executive Department

ATOMIC ENERGY COMMISSION (AEC)

19th St. & Constitution Ave., NW.

Members: 5. **Established:** Aug. 1, 1946.

Chairman: Lewis L. Strauss.

Other members: John F. Floberg, Dr. W. F. Libby, John S. Graham, Harold S. Vance.

Activities: Promotes Federally conducted and private research and development; controls dissemination of information and production, ownership and use of fissionable materials.

CIVIL AERONAUTICS BOARD (CAB)

Dept. of Commerce Bldg.

Members: 5. **Established:** June 30, 1940.

Chairman: James R. Durfee.

Activities: Regulates economic aspects of U. S. air carrier operation; prescribes safety standards; investigates and analyzes aircraft accidents; assists in development of international air transportation.

FARM CREDIT ADMINISTRATION (FCA)

South Bldg., Dept. of Agriculture.

Established: July 17, 1916.

Chairman: C. H. Matthews.

Activities: Supervises and coordinates cooperative credit system for agriculture; provides long- and short-term credit to farmers and their cooperative marketing, purchasing and business service organizations.

FEDERAL CIVIL DEFENSE ADMINISTRATION (FCDA)

Battle Creek, Mich. (Washington office: 2000 Florida Ave., NW.)

Established: 1950.

Administrator: Leo A. Hoegh.

Activities: Prepares, plans and directs civil-defense plans and programs.

SELECTIVE SERVICE SYSTEM (SSS)

451 Indiana Ave., NW.

Established: 1948.

Director: Lt. Gen. Lewis B. Hershey.

Activities: Handles registration, examination, classification and selection for induction into armed forces or other disposition of men required to register under Universal Training and Service Act.

SMALL BUSINESS ADMINISTRATION (SBA)

811 Vermont Ave., NW.

Established: July 30, 1953.

Administrator: Wendell B. Barnes.

Activities: Aids and assists the interests of small business firms to insure a fair share of total government contracts; makes loans to small firms and victims of flood and disaster.

TENNESSEE VALLEY AUTHORITY (TVA)

New Sprinkle Bldg., Knoxville, Tenn. (Wash. office: Woodward Bldg., 15th & H Sts., NW.)

Members: 3. *Established:* May 18, 1933.

Chairman: Herbert D. Vogel.

Other members: Arnold R. Jones, Raymond R. Paty.

Activities: Provides navigable channel and flood control of Tennessee River and some of its larger tributaries; disposes of surplus electric power; improves, increases and cheapens fertilizer production.

U. S. CIVIL SERVICE COMMISSION (CSC)

8th & F Sts., NW.

Members: 3. *Established:* Jan. 16, 1883.

Chairman: Harris Ellsworth.

Activities: Provides examinations to test fitness of applicants for positions in competitive service; provides personnel in response to requests from appointing officers; investigates applicants for national security purposes; classifies positions; maintains service records.

U. S. INFORMATION AGENCY (USIA)

1776 Pennsylvania Ave., NW.

Established: Aug. 1, 1953.

Director: Arthur Larson.

Activities: Directs information to foreign peoples, such as explanation and interpretation of policies of U. S. Government and delineation of U. S. life and culture.

U. S. TARIFF COMMISSION

8th & E Sts., NW.

Members: 6. *Established:* Sept. 8, 1916.

Chairman: Edgar B. Brossard.

Activities: Investigates customs laws, unfair competition and foreign and domestic manufacturing costs; advises the President on duty rates.

VETERANS' ADMINISTRATION (VA)

H St. & Vermont Ave., NW.

Established: July 21, 1930.

Administrator: H. V. Higley.

Activities: Administers laws authorizing benefits for veterans and for their dependents or beneficiaries. Included are hospitalization, pensions, insurance, loans, education, etc.

Legislative Department

GENERAL ACCOUNTING OFFICE (GAO)

441 G St., NW.

Established: June 10, 1921.

Comptroller General of the U. S.: Joseph Campbell.

Activities: Performs independent audits of government financial transactions to provide basis for settlement of accounts and to evaluate management of financial affairs by agencies; exercises power of disallowance based on Comptroller General's settlement of accounts and claims; issues reports to Congress on its findings.

LIBRARY OF CONGRESS

First St., SE, between East Capitol St. and Independence Ave.

Established: Apr. 24, 1800.

Librarian of Congress: L. Quincy Mumford.

Activities: Intended primarily for service of Congress, it has come to include entire governmental establishment and public at large. (For further description, consult index.)

U. S. Cabinet Members with Dates of Appointment

Although the Constitution made no provision for a President's advisory group, the heads of the three executive departments (State, Treasury and War) and the Attorney General were organized by Washington into such a group; and by about 1793, the name "Cabinet" was applied to it. With the exception of the Attorney General up to 1870 and the Postmaster General from 1829-72, Cabinet members have been heads of executive departments, although other government officials may be called to sit in whenever necessary.

A Cabinet member is appointed by the President, subject to the confirmation of the Senate; and as his term is not fixed, he may be replaced at any time by the

President. At a change in Administration, it is customary for him to tender his resignation, but he remains in office until a successor is appointed.

The table of Cabinet members lists only those members who actually served after being duly commissioned. It does not include ad-interim appointments or cases where the appointee declined the office after appointment.

The dates shown are those of appointment. "Contd" indicates that the term continued from the previous Administration for a substantial amount of time. Those cases where the term continued for only a few days, until a new appointment could be made, are not indicated.

¹ George Dent (Md.) was elected Speaker pro tempore for Apr. 20 and May 28, 1798. ² Resigned during 2d session of 13th Congress. ³ Resigned between 1st and 2d sessions of 16th Congress. ⁴ Resigned during 1st session of 23d Congress. ⁵ Elected Speaker and served the day of adjournment. ⁶ Died between 1st and 2d sessions of 44th Congress. During 1st session, there were two Speakers pro tempore: Samuel S. Cox (N. Y.), appointed for Feb. 17, May 12 and June 19, 1876, and Milton Saylor (Ohio), appointed for June 4, 1876. ⁷ Died 1934 after adjournment of 2nd session of 73rd Congress. ⁸ Died during 2d session of 74th Congress. ⁹ Died during 3d session of 76th Congress.

The White House

Source: National Park Service.

The White House, the official residence of the President, is located on Pennsylvania Avenue in Washington, D. C. The site covering about 18 acres was selected by President Washington and Pierre Charles L'Enfant, and the architect was James Hoban. The design of the mansion is said to have been suggested by the Duke of Leinster's Palace in Ireland. The cornerstone was laid Oct. 13, 1792, and the first residents were President and Mrs. John Adams in Nov. 1800. The building was fired by the British in 1814, and the sandstone exterior was painted white during the course of reconstruction.

The rooms for public functions are on the first floor; on the second and third are the President's apartments. The most celebrated public room is the East Room, where formal receptions take place. Other public rooms are the Red Room, the Green Room, and the

Blue Room. The State Dining Room is used for formal dinners.

The Executive Office, a three-story structure at the west end of the West Terrace, was added to the original building in 1902 to accommodate the President's office staff, and several additions have since been made. In 1942, a three-story building was erected at the end of the East Terrace, and now serves as the White House main entrance. In 1948, a second-story balcony was added to the White House inside the Ionic pillars of the south portico.

From Nov. 1948 to Mar. 1952, the White House was closed for social engagements and sightseers because of the deterioration of the building and the fear that it might collapse at any time. The walls were retained and strengthened, and the interior was rebuilt. There are now 132 rooms instead of the former 62.

THE DECLARATION OF INDEPENDENCE

IN CONGRESS, JULY 4, 1776

THE UNANIMOUS DECLARATION of the thirteen united STATES OF AMERICA.

WHEN in the Course of human events it becomes necessary for one people to dissolve the political bands which have connected them with another, and to assume among the powers of the earth, the separate and equal station to which the Laws of Nature and of Nature's God entitle them, a decent respect to the opinions of mankind requires that they should declare the causes which impel them to the separation.

We hold these truths to be self-evident, that all men are created equal, that they are endowed by their Creator with certain unalienable Rights, that among these are Life, Liberty and the pursuit of Happiness.—That to secure these rights, Governments are instituted among Men, deriving their just powers from the consent of the governed,—That whenever any Form of Government becomes destructive of these ends, it is the Right of the People to alter or to abolish it, and to institute new Government, laying its foundation on such principles and organizing its powers in such form, as to them shall seem most likely to effect their Safety and Happiness. Prudence, indeed, will dictate that Governments long established should not be changed for light and transient causes; and accordingly all experience hath shewn that mankind are more disposed to suffer, while evils are sufferable, than to right themselves by abolishing the forms to which they are accustomed. But when a long train of abuses and usurpations, pursuing invariably the same Object evinces a design to reduce them under absolute Despotism, it is their right, it is their duty, to throw off such Government, and to provide new Guards for their future security.—Such has been the patient sufferance of these Colonies; and such is now the necessity which constrains them to alter their former Systems of Government. The history of the present King of Great Britain is a history of repeated injuries and usurpations, all having in direct object the establishment of an absolute Tyranny over these States. To prove this, let Facts be submitted to a candid world.

He has refused his Assent to Laws, the most wholesome and necessary for the public good.

He has forbidden his Governors to pass Laws of immediate and pressing importance, unless suspended in their operation till his Assent should be obtained; and when so suspended, he has utterly neglected to attend to them.

He has refused to pass other Laws for the accommodation of large districts of people, unless those people would relinquish the right of Representation in the Legislature, a right inestimable to them and formidable to tyrants only.

He has called together legislative bodies at places unusual, uncomfortable, and distant from the depository of their Public Records, for the sole purpose of fatiguing them into compliance with his measures.

He has dissolved Representative Houses repeatedly, for opposing with manly firmness his invasions on the rights of the people.

He has refused for a long time, after such dissolutions, to cause others to be elected; whereby the Legislative Powers, incapable of Annihilation, have returned to the People at large for their exercise; the State remaining in the mean time exposed to all the dangers of invasion from without, and convulsions within.

NOTE: On April 12, 1776, the legislature of North Carolina authorized its delegates to the Continental Congress to join with others in a declaration of separation from Great Britain; the first colony to instruct its delegates to take the actual initiative was Virginia on May 15. On June 7, 1776, Richard Henry Lee of Virginia offered a resolution to the Congress to the effect "that these United Colonies are, and of right ought to be, free and independent States. . . ." A committee, consisting of Thomas Jefferson, John Adams, Benjamin Franklin, Robert R. Livingston and Roger

Sherman was organized to "prepare a declaration to the effect of the said first resolution." The Declaration of Independence was adopted on July 4, 1776.

Most delegates signed the Declaration August 2, but George Wythe (Va.) signed August 27; Richard Henry Lee (Va.), Elbridge Gerry (Mass.) and Oliver Wolcott (Conn.) in September; Matthew Thornton (N. H.), not a delegate until September, in November; and Thomas McKean (Del.), although present on July 4, not until 1781 by special permission, having served in the army in the interim.

He has endeavoured to prevent the population of these States; for that purpose obstructing the Laws for Naturalization of Foreigners; refusing to pass others to encourage their migrations hither, and raising the conditions of new Appropriations of Lands.

He has obstructed the Administration of Justice, by refusing his Assent to Laws for establishing Judiciary Powers.

He has made Judges dependent on his Will alone, for the tenure of their offices, and the amount and payment of their salaries.

He has erected a multitude of New Offices, and sent hither swarms of Officers to harass our people, and eat out their substance.

He has kept among us, in times of peace, Standing Armies without the Consent of our legislatures.

He has affected to render the Military independent of and superior to the Civil Power.

He has combined with others to subject us to a jurisdiction foreign to our constitution, and unacknowledged by our laws; giving his Assent to their Acts of pretended Legislation:

For quartering large bodies of armed troops among us:

For protecting them, by a mock Trial, from punishment for any Murders which they should commit on the Inhabitants of these States:

For cutting off our Trade with all parts of the world:

For imposing Taxes on us without our Consent:

For depriving us in many cases, of the benefits of Trial by Jury:

For transporting us beyond Seas to be tried for pretended offences:

For abolishing the free System of English Laws in a neighbouring Province, establishing therein an Arbitrary government, and enlarging its Boundaries so as to render it at once an example and fit instrument for introducing the same absolute rule into these Colonies:

For taking away our Charters, abolishing our most valuable Laws and altering fundamentally the Forms of our Governments:

For suspending our own Legislatures, and declaring themselves invested with power to legislate for us in all cases whatsoever.

He has abdicated Government here, by declaring us out of his Protection and waging War against us.

He has plundered our seas, ravaged our Coasts, burnt our towns, and destroyed the lives of our people.

He is at this time transporting large Armies of foreign Mercenaries to compleat the works of death, desolation and tyranny, already begun with circumstances of Cruelty & Perfidy scarcely paralleled in the most barbarous ages, and totally unworthy the Head of a civilized nation.

He has constrained our fellow Citizens taken Captive on the high Seas to bear Arms against their Country, to become the executioners of their friends and Brethren, or to fall themselves by their Hands.

He has excited domestic insurrections amongst us, and has endeavoured to bring on the inhabitants of our frontiers, the merciless Indian Savages, whose known rule of warfare, is an undistinguished destruction of all ages, sexes and conditions.

In every stage of these Oppressions We have Petitioned for Redress in the most humble terms: Our repeated Petitions have been answered only by repeated injury. A Prince, whose character is thus marked by every act which may define a Tyrant, is unfit to be the ruler of a free people.

Nor have We been wanting in attentions to our Brittish brethren. We have warned them from time to time of attempts by their legislature to extend an unwarrantable jurisdiction over us. We have reminded them of the circumstances of our emigration and settlement here. We have appealed to their native justice and magnanimity, and we have conjured them by the ties of our common kindred to disavow these usurpations, which would inevitably interrupt our connections and correspondence. They too have been deaf to the voice of justice and of consanguinity. We must, therefore, acquiesce in the necessity, which denounces our Separation, and hold them, as we hold the rest of mankind, Enemies in War, in Peace Friends.

WE, THEREFORE, the Representatives of the UNITED STATES OF AMERICA, in General Congress, Assembled, appealing to the Supreme Judge of the world for the rectitude of our intentions, do, in the Name, and by Authority of the good People of these Colonies, solemnly publish and declare, That these United Colonies are, and of Right ought to be

FREE AND INDEPENDENT STATES; that they are Absolved from all Allegiance to the British Crown, and that all political connection between them and the State of Great Britain, is and ought to be totally dissolved; and that as Free and Independent States, they have full Power to levy War, conclude Peace, contract Alliances, establish Commerce, and to do all other Acts and Things which Independent States may of right do.—And for the support of this Declaration, with a firm reliance on the protection of Divine Providence, we mutually pledge to each other our Lives, our Fortunes and our sacred Honor.

IN CONGRESS

JANUARY, 18, 1777.

Ordered:

That an authenticated copy of the Declaration of Independency, with the names of the Members of Congress subscribing the same, be sent to each of the United States, and that they be desired to have the same put on record.

By order of Congress.

Attest, CHAS. THOMSON, *Secy.* A true copy. JOHN HANCOCK, *Presidt.*

The Statue of Liberty

The Statue of Liberty ("Liberty Enlightening the World") is a 225-ton copper female figure, 152 ft. 5 in. in height, facing the ocean from Liberty* Island in New York Harbor. The right hand holds aloft a torch, and the left hand carries a tablet upon which is inscribed: "July 4, 1776."

The statue was designed by Frédéric Auguste Bartholdi, at the request of the French government, as a present to the U. S. to commemorate the centennial of American independence. It cost \$450,000.

The pedestal, 151 ft. 1 in. in height, was erected by the U. S., and its cost of \$350,000 was met by popular subscription in this country. The cornerstone was laid Aug.

* Called Bedloe's Island prior to 1956.

5, 1884, and the unvelling of the statue took place Oct. 28, 1886.

On a tablet inside the main entrance of the pedestal is engraved the following sonnet, written by Emma Lazarus:

The New Colossus

Not like the brazen giant of Greek fame,
With conquering limbs astride from land to land;
Here at our sea-washed, sunset gates shall stand
A mighty woman with a torch, whose flame
Is the imprisoned lightning, and her name
Mother of Exiles. From her beacon hand
Glows world-wide welcome; her mild eyes com-
mand
The air-brided harbor that twin cities frame.
"Keep, ancient lands, your storied pomp!" cries she
With silent lips. "Give me your tired, your poor,
Your huddled masses yearning to breathe free,
The wretched refuse of your teeming shore.
Send these, the homeless, tempest-tost to me,
I lift my lamp beside the golden door."

CONSTITUTION of the UNITED STATES OF AMERICA

THE oldest federal constitution in existence was framed by a convention of delegates from twelve of the thirteen original states in Philadelphia in May 1787, Rhode Island failing to send a delegate. George Washington presided over the session, which lasted until September 17, 1787. The draft (originally a preamble and seven Articles) was submitted to all thirteen states and was to become effective when ratified by nine states. It went into effect on the first Wednesday in March 1789, having been ratified by New Hampshire, the ninth state to approve, on June 21, 1788. The states ratified the Constitution in the following order:

Delaware	December 7, 1787	South Carolina	May 23, 1788
Pennsylvania	December 12, 1787	New Hampshire	June 21, 1788
New Jersey	December 18, 1787	Virginia	June 25, 1788
Georgia	January 2, 1788	New York	July 26, 1788
Connecticut	January 9, 1788	North Carolina	November 21, 1789
Massachusetts	February 6, 1788	Rhode Island	May 29, 1790
Maryland	April 28, 1788		

Outline of the Constitution

ARTICLE I

SEC. 1. Legislative powers; in whom vested.

SEC. 2. House of Representatives, how and by whom chosen—Qualifications of a Representative—Representatives and direct taxes, how apportioned—Enumeration—Vacancies to be filled—Power of choosing officers, and of impeachment.

SEC. 3. Senators, how and by whom chosen—How classified—State Executive, when to make temporary appointments, in case, etc.—Qualifications of a Senator—President of the Senate, his right to vote—President pro tem., and other officers of the Senate, how chosen—Power to try impeachments—When President is tried, Chief Justice to preside—Sentence.

SEC. 4. Times, etc., of holding elections, how prescribed—At least one Session in each year.

SEC. 5. Membership—Quorum—Adjournments—Rules—Power to punish or expel—Journal—Time of adjournments, how limited, etc.

SEC. 6. Compensation—Privileges—Disqualification in certain cases.

SEC. 7. House to originate all revenue bills—Veto—Bill may be passed by two-thirds of each house, notwithstanding, etc.—Bill, not returned in ten days, to become a law—Provisions as to orders, concurrent resolutions, etc.

SEC. 8. Powers of Congress.

SEC. 9. Provision as to migration or importation of certain persons—Habeas Corpus—Bills of attainder, etc.—Taxes, how apportioned—No export duty—No commercial preference—Money, how drawn from treasury, etc.—No titular nobility—Officers not to receive presents, etc.

SEC. 10. States prohibited from the exercise of certain powers.

ARTICLE II

SEC. 1. President; his term of office—Electors of President; number and how appointed—Electors to vote on same day—Qualification of President—On whom his duties devolve in case of his removal, death, etc.—President's compensation—His oath of office.

SEC. 2. President to be commander in chief—He may require opinions of Cabinet Officers, etc., may pardon—Treaty-making power—Nomination of certain officers—When President may fill vacancies.

SEC. 3. President shall communicate to Congress—He may convene and adjourn Congress, in case of disagreement, etc.—Shall receive ambassadors, execute laws, and commission officers.

SEC. 4. All civil offices forfeited for certain crimes.

ARTICLE III

SEC. 1. Judicial powers—Tenure—Compensation.

SEC. 2. Judicial power; to what cases it extends—Original jurisdiction of Supreme Court—Appellate—Trial by jury, etc.—Trial, where.

SEC. 3. Treason defined—Proof of—Punishment of.

ARTICLE IV

SEC. 1. Each State to give credit to the public acts, etc., of every other State.

SEC. 2. Privileges of citizens of each State—Fugitives from justice to be delivered up—Persons held to service having escaped, to be delivered up.

SEC. 3. Admission of new States—Power of Congress over territory and other property.

SEC. 4. Republican form of government guaranteed—Each State to be protected.

ARTICLE V

Constitution; how amended—Proviso.

ARTICLE VI

Certain debts, etc., declared valid—Supremacy of Constitution, treaties, and laws of the United States—Oath to support Constitution, by whom taken—No religious test.

ARTICLE VII

What ratification shall establish Constitution.

AMENDMENTS

- I. Religious establishment prohibited—Freedom of speech, of the press, and right to petition.
- II. Right to keep and bear arms.
- III. No soldier to be quartered in any house, unless, etc.
- IV. Right of search and seizure regulated.
- V. Provisions concerning prosecution, trial and punishment—Private property not to be taken for public use, without compensation.
- VI. Further provision respecting criminal prosecutions.
- VII. Right of trial by jury secured.

VIII. Excessive bail or fines and cruel punishments prohibited.

IX. Rule of construction of Constitution.

X. Same subject; rights of States.

XI. Same subject; judicial powers construed.

XII. Manner of choosing President and Vice President.

XIII. Slavery abolished.

XIV. Citizenship; representation—Public debt.

XV. Right of suffrage—By whom exercised.

XVI. Taxes on incomes.

XVII. Election of Senators—Filling of vacancies.

XVIII. Prohibition.

XIX. Suffrage; not to be denied because of sex.

XX. Commencement of terms of President, Vice President and members of Congress; time of assembling of Congress.

XXI. Repeal of Prohibition.

XXII. No person to serve as President for more than two terms.

The Constitution of the United States of America

PREAMBLE.—WE THE PEOPLE of the United States, in Order to form a more perfect Union, establish Justice, insure domestic Tranquility, provide for the common defence, promote the general Welfare, and secure the Blessings of Liberty to ourselves and our Posterity, do ordain and establish this Constitution for the United States of America.

ARTICLE I

Section 1

Legislative powers vested in Congress.—All legislative Powers herein granted shall be vested in a Congress of the United States, which shall consist of a Senate and House of Representatives.

Section 2

Composition of the House of Representatives.—1. The House of Representatives shall be composed of Members chosen every second Year by the People of the several States, and the Electors in each State shall have the Qualifications requisite for Electors of the most numerous Branch of the State Legislature.

Qualifications of Representatives.—2. No Person shall be a Representative who shall not have attained to the Age of twenty-five Years, and been seven Years a Citizen

of the United States, and who shall not, when elected, be an Inhabitant of that State in which he shall be chosen.

Apportionment of Representatives and direct taxes—census.*—3. [Representatives and direct Taxes shall be apportioned among the several States which may be included within this Union, according to their respective Numbers, which shall be determined by adding to the whole Number of free Persons, including those bound to Service for a Term of Years, and excluding Indians not taxed, three fifths of all other Persons.] The actual Enumeration shall be made within three Years after the first Meeting of the Congress of the United States, and within every subsequent Term of ten Years, in such Manner as they shall by Law direct. The Number of Representatives shall not exceed one for every thirty Thousand, but each State shall have at Least one Representative; and until such enumeration shall be made, the State of New Hampshire shall be entitled to chuse three, Massachusetts eight, Rhode-Island and Providence Plantations one, Connecticut five, New York six, New Jersey four, Pennsylvania eight, Delaware one, Maryland six, Virginia ten, North Carolina five, South Carolina five, and Georgia three.

Filling of vacancies in representation.—4. When vacancies happen in the Representation from any State, the Executive

* The clause included in brackets is amended by the 14th Amendment, Section 2.

Authority thereof shall issue Writs of Election to fill such Vacancies.

Selection of officers; power of impeachment.—5. The House of Representatives shall chuse their Speaker and other Officers; and shall have the sole Power of Impeachment.

Section 3*

The Senate.—[1. The Senate of the United States shall be composed of two Senators from each State, chosen by the Legislature thereof, for six Years; and each Senator shall have one Vote.]

Classification of Senators; filling of vacancies.—2. Immediately after they shall be assembled in Consequence of the first Election, they shall be divided as equally as may be into three Classes. The Seats of the Senators of the first Class shall be vacated at the Expiration of the second Year, of the second Class at the Expiration of the fourth Year, and of the third Class at the Expiration of the sixth Year, so that one-third may be chosen every second Year; and if Vacancies happen by Resignation, or otherwise, during the Recess of the Legislature of any State, the Executive thereof may make temporary Appointments [until the next Meeting of the Legislature, which shall then fill such Vacancies].

Qualification of Senators.—3. No Person shall be a Senator who shall not have attained to the Age of thirty Years, and been nine Years a Citizen of the United States, and who shall not, when elected, be an Inhabitant of that State for which he shall be chosen.

Vice President to be President of Senate.

—4. The Vice President of the United States shall be President of the Senate, but shall have no Vote, unless they be equally divided.

Selection of Senate officers; President pro tempore.—5. The Senate shall chuse their other Officers, and also a President pro tempore, in the Absence of the Vice President, or when he shall exercise the Office of President of the United States.

Senate to try impeachments.—6. The Senate shall have the sole Power to try all Impeachments. When sitting for that Purpose, they shall be on Oath or Affirmation. When the President of the United States is tried, the Chief Justice shall preside: And no Person shall be convicted without the Concurrence of two thirds of the Members present.

Judgment in cases of impeachment.—7. Judgment in Cases of Impeachment shall not extend further than to removal from Office, and disqualification to hold and en-

joy any Office of honor, Trust, or Profit under the United States: but the Party convicted shall nevertheless be liable and subject to Indictment, Trial, Judgment and Punishment, according to Law.

Section 4

Control of congressional elections.—1. The Times, Places and Manner of holding Elections for Senators and Representatives, shall be prescribed in each State by the Legislature thereof; but the Congress may at any time by Law make or alter such Regulations, except as to the Places of chusing Senators.

Time for assembling of Congress.†—2. The Congress shall assemble at least once in every Year, and such Meeting shall be on the first Monday in December, unless they shall by Law appoint a different Day.

Section 5

Each house to be the judge of the election and qualifications of its members; regulations as to quorum.—1. Each House shall be the Judge of the Elections, Returns and Qualifications of its own Members, and a Majority of each shall constitute a Quorum to do Business; but a smaller Number may adjourn from day to day, and may be authorized to compel the Attendance of absent Members, in such Manner, and under such Penalties as each House may provide.

Each house to determine its own rules.—2. Each House may determine the Rules of its Proceedings, punish its Members for disorderly Behaviour, and, with the Concurrence of two thirds, expel a Member.

Journals and yeas and nays.—3. Each House shall keep a Journal of its Proceedings, and from time to time publish the same, excepting such Parts as may in their Judgment require Secrecy; and the Yeas and Nays of the Members of either House on any question shall, at the Desire of one fifth of those Present, be entered on the Journal.

Adjournment.—4. Neither House, during the Session of Congress shall, without the Consent of the other, adjourn for more than three days, nor to any other Place than that in which the two Houses shall be sitting.

Section 6

Compensation and privileges of Members of Congress.—1. The Senators and Representatives shall receive a Compensation for their Services, to be ascertained by Law, and paid out of the Treasury of the United States. They shall in all Cases, except Treason, Felony and Breach of the

* The 1st paragraph of this section and as much of the 2nd paragraph as relates to filling vacancies are amended by the 17th Amendment.

† Amended by the 20th Amendment, Section 2.

Peace, be privileged from Arrest during their Attendance at the Session of their respective Houses, and in going to and returning from the same; and for any Speech or Debate in either House, they shall not be questioned in any other Place.

Incompatible offices; exclusions.—2. No Senator or Representative shall, during the Time for which he was elected, be appointed to any civil Office under the Authority of the United States, which shall have been created, or the Emoluments whereof shall have been increased during such time; and no Person holding any Office under the United States, shall be a Member of either House during his Continuance in Office.

Section 7

Revenue bills to originate in House.—1. All Bills for raising Revenue shall originate in the House of Representatives; but the Senate may propose or concur with Amendments as on other Bills.

Manner of passing bills; veto power of President.—2. Every Bill which shall have passed the House of Representatives and the Senate, shall, before it becomes a Law, be presented to the President of the United States; If he approve he shall sign it, but if not he shall return it, with his Objections to that House in which it shall have originated, who shall enter the Objections at large on their Journal, and proceed to reconsider it. If after such Reconsideration two thirds of that House shall agree to pass the Bill, it shall be sent, together with the Objections, to the other House, by which it shall likewise be reconsidered, and if approved by two thirds of that House, it shall become a Law. But in all such Cases the Votes of both Houses shall be determined by Yeas and Nays, and the Names of the Persons voting for and against the Bill shall be entered on the Journal of each House respectively. If any Bill shall not be returned by the President within ten Days (Sundays excepted) after it shall have been presented to him, the Same shall be a Law, in like Manner as if he had signed it, unless the Congress by their Adjournment prevent its Return, in which Case it shall not be a Law.

Concurrent orders or resolutions, to be passed by President.—3. Every Order, Resolution, or Vote to which the Concurrence of the Senate and House of Representatives may be necessary (except on a question of adjournment) shall be presented to the President of the United States; and before the Same shall take Effect, shall be approved by him, or being disapproved by him, shall be repassed by two thirds of the Senate and House of Representatives, according to the Rules and Limitations prescribed in the Case of a Bill.

Section 8

General powers of Congress.*

The Congress shall have Power.—1. To lay and collect Taxes, Duties, Imposts and Excises, to pay the Debts and provide for the common Defence and general Welfare of the United States; but all Duties, Imposts and Excises shall be uniform throughout the United States;

Borrowing of money.—2. To borrow Money on the credit of the United States;

Regulation of commerce.—3. To regulate Commerce with foreign Nations, and among the several States, and with the Indian Tribes;

Naturalization and bankruptcy.—4. To establish a uniform Rule of Naturalization, and uniform Laws on the subject of Bankruptcies throughout the United States;

Money, weights and measures.—5. To coin Money, regulate the Value thereof, and of foreign Coin, and fix the Standard of Weights and Measures;

Counterfeiting.—6. To provide for the Punishment of counterfeiting the Securities and current Coin of the United States;

Post offices.—7. To establish Post Offices and post Roads;

Patents and copyrights.—8. To promote the Progress of Science and useful Arts, by securing for limited Times to Authors and Inventors the exclusive Right to their respective Writings and Discoveries;

Inferior courts.—9. To constitute Tribunals inferior to the supreme Court;

Piracies and felonies.—10. To define and punish Piracies and Felonies committed on the high Seas, and Offences against the Law of Nations;

War; marque and reprisal.—11. To declare War, grant Letters of Marque and Reprisal, and make Rules concerning Captures on Land and Water;

Armies.—12. To raise and support Armies, but no Appropriation of Money to that Use shall be for a longer Term than two Years;

Navy.—13. To provide and maintain a Navy;

Land and naval forces.—14. To make Rules for the Government and Regulation of the land and naval Forces;

Calling out militia.—15. To provide for calling forth the Militia to execute the Laws of the Union, suppress Insurrections and repel Invasions;

Organizing, arming and disciplining militia.—16. To provide for organizing, arming, and disciplining, the Militia, and for governing such Part of them as may be

* By the 16th Amendment, Congress is given the power to lay and collect taxes on incomes.

employed in the Service of the United States, reserving to the States respectively, the Appointment of the Officers, and the Authority of training the Militia according to the discipline prescribed by Congress;

Exclusive legislation over District of Columbia.—17. To exercise exclusive Legislation in all Cases whatsoever, over such District (not exceeding ten Miles square) as may, by Cession of particular States, and the Acceptance of Congress, become the Seat of the Government of the United States, and to exercise like Authority over all Places purchased by the Consent of the Legislature of the State in which the Same shall be, for the Erection of Forts, Magazines, Arsenals, dock-Yards, and other needful Buildings;—And

To enact laws necessary to enforce Constitution.—18. To make all Laws which shall be necessary and proper for carrying into Execution the foregoing Powers, and all other Powers vested by this Constitution in the Government of the United States, or in any Department or Officer thereof.

Section 9

Migration or importation of certain persons not to be prohibited before 1808.—1. The Migration or Importation of such Persons as any of the States now existing shall think proper to admit, shall not be prohibited by the Congress prior to the Year one thousand eight hundred and eight, but a Tax or duty may be imposed on such Importation, not exceeding ten dollars for each Person.

Writ of habeas corpus not to be suspended; exception.—2. The Privilege of the Writ of Habeas Corpus shall not be suspended, unless when in Cases of Rebellion or Invasion the public Safety may require it.

Bills of attainder and ex post facto laws prohibited.—3. No Bill of Attainder or ex post facto Law shall be passed.

Capitation and other direct taxes.—4. No Capitation, or other direct, Tax shall be laid, unless in Proportion to the Census or Enumeration herein before directed to be taken.*

Exports not to be taxed.—5. No Tax or Duty shall be laid on Articles exported from any State.

No preference to be given to ports of any State; interstate shipping.—6. No Preference shall be given by any Regulation of Commerce or Revenue to the Ports of one State over those of another: nor shall Vessels bound to, or from, one State, be obliged to enter, clear, or pay Duties in another.

Money, how drawn from treasury; finan-

cial statements to be published.—7. No Money shall be drawn from the Treasury, but in Consequence of Appropriations made by Law; and a regular Statement and Account of the Receipts and Expenditures of all public Money shall be published from time to time.

Titles of nobility not to be granted; acceptance by government officers of favors from foreign powers.—8. No Title of Nobility shall be granted by the United States: And no Person holding any Office of Profit or Trust under them, shall, without the Consent of the Congress, accept of any present, Emolument, Office, or Title, of any kind whatever, from any King, Prince, or foreign State.

Section 10

Limitations of the powers of the several States.—1. No State shall enter into any Treaty, Alliance, or Confederation; grant Letters of Marque and Reprisal; coin Money; emit Bills of Credit; make any Thing but gold and silver Coin a Tender in Payment of Debts; pass any Bill of Attainder, ex post facto Law, or Law impairing the Obligation of Contracts, or grant any Title of Nobility.

State imposts and duties.—2. No State shall, without the Consent of the Congress, lay any Imposts or Duties on Imports or Exports, except what may be absolutely necessary for executing its inspection Laws: and the net Produce of all Duties and Imposts, laid by any State on Imports or Exports, shall be for the Use of the Treasury of the United States; and all such Laws shall be subject to the Revision and Control of the Congress.

Further restrictions on powers of States.—3. No State shall, without the Consent of Congress, lay any Duty of Tonnage, keep Troops, or Ships of War in time of Peace, enter into any Agreement or Compact with another State, or with a foreign Power, or engage in War, unless actually invaded, or in such imminent Danger as will not admit of delay.

ARTICLE II

Section 1

The President; the executive power.—1. The executive Power shall be vested in a President of the United States of America. He shall hold his Office during the Term of four Years, and, together with the Vice President, chosen for the same Term, be elected, as follows

Appointment and qualifications of presidential electors.—2. Each State shall appoint, in such Manner as the Legislature thereof may direct, a Number of Electors, equal to the whole Number of Senators and

* See the 16th Amendment.

Representatives to which the State may be entitled in the Congress: but no Senator or Representative, or Person holding an Office of Trust or Profit under the United States, shall be appointed an Elector.

Original method of electing the President and Vice-President.*—[The Electors shall meet in their respective States, and vote by Ballot for two Persons, of whom one at least shall not be an Inhabitant of the same State with themselves. And they shall make a List of all the Persons voted for, and of the Number of Votes for each; which List they shall sign and certify, and transmit sealed to the Seat of the Government of the United States, directed to the President of the Senate. The President of the Senate shall, in the Presence of the Senate and House of Representatives, open all the Certificates, and the Votes shall then be counted. The Person having the greatest Number of Votes shall be the President, if such Number be a Majority of the whole Number of Electors appointed; and if there be more than one who have such Majority, and have an equal Number of Votes, then the House of Representatives shall immediately chuse by Ballot one of them for President; and if no person have a Majority, then from the five highest on the List the said House shall in like Manner chuse the President. But in chusing the President, the Votes shall be taken by States, the Representation from each State having one Vote; A quorum for this Purpose shall consist of a Member or Members from two thirds of the States, and a Majority of all the States shall be necessary to a Choice. In every Case, after the Choice of the President, the Person having the greatest Number of Votes of the Electors shall be the Vice President. But if there should remain two or more who have equal Votes, the Senate should chuse from them by Ballot the Vice President.]

Congress may determine time of choosing electors and day for casting their votes.—3. The Congress may determine the Time of chusing the Electors, and the Day on which they shall give their Votes; which Day shall be the same throughout the United States.

Qualifications for the office of President.†—4. No Person except a natural born Citizen, or a Citizen of the United States, at the time of the Adoption of this Constitution, shall be eligible to the Office of President; neither shall any Person be eligible to that Office who shall not have attained to the Age of thirty five Years, and been fourteen Years a Resident within the United States.

Filling vacancy in the office of Presi-

dent.‡—5. In Case of the Removal of the President from Office, or of his Death, Resignation, or Inability to discharge the Powers and Duties of the said Office, the same shall devolve on the Vice President, and the Congress may by Law provide for the Case of Removal, Death, Resignation or Inability, both of the President and Vice President, declaring what Officer shall then act as President, and such Officer shall act accordingly, until the Disability be removed, or a President shall be elected.

Compensation of the President.—6. The President shall, at stated Times, receive for his Services, a Compensation, which shall neither be increased nor diminished during the Period for which he shall have been elected, and he shall not receive within that Period any other Emolument from the United States, or any of them.

Oath to be taken by the President.—7. Before he enter on the Execution of his Office, he shall take the following Oath or Affirmation:—"I do solemnly swear (or affirm) that I will faithfully execute the Office of President of the United States, and will to the best of my Ability, preserve, protect and defend the Constitution of the United States."

Section 2

The President to be commander-in-chief of army and navy and head of executive departments; may grant reprieves and pardons.—1. The President shall be Commander in Chief of the Army and Navy of the United States, and of the Militia of the several States, when called into the actual Service of the United States; he may require the Opinion, in writing, of the principal Officer in each of the executive Departments, upon any subject relating to the Duties of their respective Offices, and he shall have Power to grant Reprieves and Pardons for Offences against the United States, except in Cases of Impeachment.

President may, with concurrence of Senate, make treaties, appoint ambassadors, etc.; appointment of inferior officers, authority of Congress over.—2. He shall have Power, by and with the Advice and Consent of the Senate, to make Treaties, provided two thirds of the Senators present concur; and he shall nominate, and by and with the Advice and Consent of the Senate, shall appoint Ambassadors, other public Ministers and Consuls, Judges of the supreme Court, and all other Officers of the United States, whose Appointments are not herein otherwise provided for, and which shall be established by Law: but the Congress may by Law vest the Appointment of such inferior Officers, as they think proper, in the President alone, in

* This clause has been superseded by the 12th Amendment.

† For qualifications of the Vice President, see 12th Amendment.

‡ Amended by the 20th Amendment, Sections 3 and 4.

the Courts of Law, or in the Heads of Departments.

President may fill vacancies in office during recess of Senate.—3. The President shall have Power to fill up all Vacancies that may happen during the Recess of the Senate, by granting Commissions which shall expire at the End of their next Session.

Section 3

President to give advice to Congress; may convene or adjourn it on certain occasions; to receive ambassadors, etc.; have laws executed and commission all officers.—He shall from time to time give to the Congress Information of the State of the Union, and recommend to their Consideration such Measures as he shall judge necessary and expedient; he may, on extraordinary Occasions, convene both Houses, or either of them, and in Case of Disagreement between them, with Respect to the Time of Adjournment, he may adjourn them to such Time as he shall think proper; he shall receive Ambassadors and other public Ministers; he shall take Care that the Laws be faithfully executed, and shall Commission all the Officers of the United States.

Section 4

All civil officers removable by impeachment.—1. The President, Vice President and all civil Officers of the United States, shall be removed from Office on Impeachment for, and Conviction of, Treason, Bribery, or other high Crimes and Misdemeanors.

ARTICLE III

Section 1

Judicial powers; how vested; term of office and compensation of judges.—The judicial Power of the United States, shall be vested in one supreme Court, and in such inferior Courts as the Congress may from time to time ordain and establish. The Judges, both of the supreme and inferior Courts, shall hold their Offices during good Behaviour, and shall, at stated Times, receive for their Services, a Compensation, which shall not be diminished during their Continuance in Office.

Section 2

Jurisdiction of Federal courts.*—1. The judicial Power shall extend to all Cases, in Law and Equity, arising under this Constitution, the Laws of the United States, and Treaties made, or which shall be made, under their Authority;—to all Cases affecting Ambassadors, other public Ministers and Consuls;—to all Cases of Admiralty and maritime Jurisdiction;—to Controversies to which the United States shall be a Party;—to Controversies between two or more States;—between a State and

Citizens of another State;—between Citizens of different States,—between Citizens of the same State claiming Lands under Grants of different States, and between a State, or the Citizens thereof, and foreign States, Citizens or Subjects.

Original and appellate jurisdiction of Supreme Court.—2. In all Cases affecting Ambassadors, other public Ministers and Consuls, and those in which a State shall be Party, the supreme Court shall have original Jurisdiction. In all the other Cases before mentioned, the supreme Court shall have appellate Jurisdiction, both as to Law and Fact, with such Exceptions, and under such Regulations as the Congress shall make.

Trial of all crimes, except impeachment, to be by jury.—3. The Trial of all Crimes, except in Cases of Impeachment, shall be by Jury; and such Trial shall be held in the State where the said Crimes shall have been committed; but when not committed within any State, the Trial shall be at such Place or Places as the Congress may by Law have directed.

Section 3

Treason defined; conviction of.—1. Treason against the United States, shall consist only in levying War against them, or, in adhering to their Enemies, giving them Aid and Comfort. No Person shall be convicted of Treason unless on the Testimony of two Witnesses to the same overt Act, or on Confession in open Court.

Congress to declare punishment for treason; proviso.—2. The Congress shall have power to declare the Punishment of Treason, but no Attainder of Treason shall work Corruption of Blood, or Forfeiture except during the Life of the Person attainted.

ARTICLE IV

Section 1

Each State to give full faith and credit to the public acts and records of other States.—Full Faith and Credit shall be given in each State to the public Acts, Records, and judicial Proceedings of every other State. And the Congress may by general Laws prescribe the Manner in which such Acts, Records and Proceedings shall be proved, and the Effect thereof.

Section 2

Privileges of citizens.—1. The Citizens of each State shall be entitled to all Privileges and Immunities of Citizens in the several States.

Extradition between the several States.—2. A Person charged in any State with Treason, Felony, or other Crime, who shall flee from Justice, and be found in another State, shall on Demand of the executive

* This section is abridged by the 11th Amendment.

Authority of the State from which he fled, be delivered up, to be removed to the State having Jurisdiction of the Crime.

Persons held to labor or service in one State, fleeing to another, to be returned.*

—3. No Person held to Service or Labour in one State, under the Laws thereof, escaping into another, shall, in Consequence of any Law or Regulation therein, be discharged from such Service or Labour, but shall be delivered up on Claim of the Party to whom such Service or Labour may be due.

Section 3

New States.—1. New States may be admitted by the Congress into this Union; but no new State shall be formed or erected within the Jurisdiction of any other State; nor any State be formed by the Junction of two or more States, or Parts of States, without the Consent of the Legislatures of the States concerned as well as of the Congress.

Regulations concerning territory.—2. The Congress shall have Power to dispose of and make all needful Rules and Regulations respecting the Territory or other Property belonging to the United States; and nothing in this Constitution shall be so construed as to Prejudice any Claims of the United States, or of any particular State.

Section 4

Republican form of government and protection guaranteed the several States.—The United States shall guarantee to every State in this Union a Republican Form of Government, and shall protect each of them against Invasion; and on Application of the Legislature, or of the Executive (when the Legislature cannot be convened) against domestic Violence.

ARTICLE V

Ways in which the Constitution can be amended.—The Congress, whenever two thirds of both Houses shall deem it necessary, shall propose Amendments to this Constitution, or, on the Application of the Legislatures of two thirds of the several States, shall call a Convention for proposing Amendments, which, in either Case, shall be valid to all Intents and Purposes, as Part of this Constitution, when ratified by the Legislatures of three fourths of the several States, or by Conventions in three fourths thereof, as the one or the other Mode of Ratification may be proposed by the Congress; Provided that no Amendment which may be made prior to the Year One thousand eight hundred and eight shall in any Manner affect the first and fourth Clauses in the Ninth Section of the first Article; and that no State, without its Consent, shall be deprived of its equal Suffrage in the Senate.

* See the 13th Amendment.

ARTICLE VI

Debts contracted under the confederation secured.—1. All Debts contracted and Engagements entered into, before the Adoption of this Constitution, shall be as valid against the United States under this Constitution, as under the Confederation.

Constitution, laws and treaties of the United States to be supreme.—2. This Constitution, and the Laws of the United States which shall be made in Pursuance thereof; and all Treaties made, or which shall be made, under the Authority of the United States, shall be the supreme Law of the Land; and the Judges in every State shall be bound thereby, any Thing in the Constitution or Laws of any State to the Contrary notwithstanding.

Who shall take constitutional oath; no religious test as to official qualification.—3. The Senators and Representatives before mentioned, and the Members of the several State Legislatures, and all executive and judicial Officers, both of the United States and of the several States, shall be bound by Oath or Affirmation, to support this Constitution; but no religious Test shall ever be required as a Qualification to any Office or public Trust under the United States.

ARTICLE VII

Constitution to be considered adopted when ratified by nine States.—The Ratification of the Conventions of nine States shall be sufficient for the Establishment of this Constitution between the States so ratifying the Same.

Done in Convention by the Unanimous Consent of the States present the Seventeenth Day of September in the Year of our Lord one thousand seven hundred and Eighty seven and of the Independence of the United States of America the Twelfth. In witness whereof We have hereunto subscribed our Names.

AMENDMENTS TO THE CONSTITUTION OF THE UNITED STATES

(Amendments I to X inclusive, popularly known as the Bill of Rights, were proposed and sent to the states by the first session of the First Congress. They became effective Dec. 15, 1791.)

ARTICLE I

Freedom of religion, speech, of the press, and right of petition.—Congress shall make no law respecting an establishment of religion, or prohibiting the free exercise thereof; or abridging the freedom of speech, or of the press; or the right of the people peaceably to assemble, and to petition the Government for a redress of grievances.

ARTICLE II

Right of people to bear arms not to be infringed.—A well regulated Militia, being necessary to the security of a free State, the right of the people to keep and bear Arms, shall not be infringed.

ARTICLE III

Quartering of troops.—No Soldier shall, in time of peace be quartered in any house, without the consent of the Owner, nor in time of war, but in a manner to be prescribed by law.

ARTICLE IV

Persons and houses to be secure from unreasonable searches and seizures.—The right of the people to be secure in their persons, houses, papers, and effects, against unreasonable searches and seizures, shall not be violated, and no Warrants shall issue, but upon probable cause, supported by Oath or affirmation, and particularly describing the place to be searched, and the persons or things to be seized.

ARTICLE V

Trials for crimes; just compensation for private property taken for public use.—No person shall be held to answer for a capital, or otherwise infamous crime, unless on a presentment or indictment of a Grand Jury, except in cases arising in the land or naval forces, or in the Militia, when in actual service in time of War or public danger; nor shall any person be subject for the same offence to be twice put in jeopardy of life or limb; nor shall be compelled in any criminal case to be a witness against himself, nor be deprived of life, liberty, or property, without due process of law; nor shall private property be taken for public use, without just compensation.

ARTICLE VI

Civil rights in trials for crimes enumerated.—In all criminal prosecutions, the accused shall enjoy the right to a speedy and public trial, by an impartial jury of the State and district wherein the crime shall have been committed, which district shall have been previously ascertained by law, and to be informed of the nature and cause of the accusation; to be confronted with the witnesses against him; to have compulsory process for obtaining witnesses in his favor, and to have the Assistance of Counsel for his defence.

ARTICLE VII

Civil rights in civil suits.—In Suits at common law, where the value in controversy shall exceed twenty dollars, the right of trial by jury shall be preserved, and no fact tried by a jury, shall be otherwise re-examined in any Court of the United States, than according to the rules of the common law.

ARTICLE VIII

Excessive bail, fines and punishments prohibited.—Excessive bail shall not be required, nor excessive fines imposed, nor cruel and unusual punishments inflicted.

ARTICLE IX

Reserved rights of people.—The enumeration in the Constitution, of certain rights, shall not be construed to deny or disparage others retained by the people.

ARTICLE X

Powers not delegated, reserved to states and people respectively.—The powers not delegated to the United States by the Constitution, nor prohibited by it to the States, are reserved to the States respectively, or to the people.

ARTICLE XI

(The proposed amendment was sent to the states Mar. 5, 1794, by the Third Congress. It became effective Jan. 8, 1798.)

Judicial power of United States not to extend to suits against a State.—The Judicial power of the United States shall not be construed to extend to any suit in law or equity, commenced or prosecuted against one of the United States by Citizens of another State, or by Citizens or Subjects of any Foreign State.

ARTICLE XII

(The proposed amendment was sent to the states Dec. 12, 1803, by the Eighth Congress. It became effective Sept. 26, 1804.)

Present mode of electing President and Vice-President by electors.*—The Electors shall meet in their respective states, and vote by ballot for President and Vice-President, one of whom, at least, shall not be an inhabitant of the same state with themselves; they shall name in their ballots the person voted for as President, and in distinct ballots the person voted for as Vice-President, and they shall make distinct lists of all persons voted for as President, and of all persons voted for as Vice-President, and of the number of votes for each, which lists they shall sign and certify, and transmit sealed to the seat of the government of the United States, directed to the President of the Senate;—The President of the Senate shall, in the presence of the Senate and House of Representatives, open all the certificates and the votes shall then be counted;—The person having the greatest number of votes for President, shall be the President, if such number be a majority of the whole number of Electors appointed; and if no person have such majority, then from the persons having the highest numbers not exceeding three on the list of those voted for as President, the House of Representatives shall choose immediately, by ballot, the President. But in choosing the President, the votes shall be taken by states, the representation from each State having one vote; a quorum for this purpose shall consist of a member or members from two-thirds of the states, and a majority of all the states shall be necessary to a choice. And if the House of Representatives shall not choose a President whenever the right of choice shall devolve upon them, before the fourth day of March next following, then the Vice-President shall act as President, as in the case of the death or other constitutional disability of the President.—The person having the greatest number of votes as Vice-President, shall be the Vice-President, if such number be a majority of the whole number of Electors appointed, and if no person have a majority, then from the two highest numbers on the list, the Senate shall choose the Vice-President; a quorum for the purpose shall consist of two-thirds of the whole number of Senators, and a majority of the whole number shall be necessary to a choice. But no person constitutionally ineligible to the office of President shall be eligible to that of Vice-President of the United States.

ARTICLE XIII

(The proposed amendment was sent to the states Feb. 1, 1865, by the Thirty-eighth Congress. It became effective Dec. 18, 1865.)

Section 1

Slavery prohibited.—Neither slavery nor

involuntary servitude, except as a punishment for crime whereof the party shall have been duly convicted, shall exist within the United States, or any place subject to their jurisdiction.

Section 2

Congress given power to enforce this article.—Congress shall have power to enforce this article by appropriate legislation.

ARTICLE XIV

(The proposed amendment was sent to the states June 16, 1866, by the Thirty-ninth Congress. It became effective July 28, 1868.)

Section 1

Citizenship defined; privileges of citizens.—All persons born or naturalized in the United States, and subject to the jurisdiction thereof, are citizens of the United States and of the State wherein they reside. No State shall make or enforce any law which shall abridge the privileges or immunities of citizens of the United States; nor shall any State deprive any person of life, liberty, or property, without due process of law; nor deny to any person within its jurisdiction the equal protection of the laws.

Section 2

Apportionment of Representatives.—Representatives shall be apportioned among the several States according to their respective numbers, counting the whole number of persons in each State, excluding Indians not taxed. But when the right to vote at any election for the choice of electors for President and Vice-President of the United States, Representatives in Congress, the Executive and Judicial officers of a State, or the members of the Legislature thereof, is denied to any of the male inhabitants of such State, being twenty-one years of age, and citizens of the United States, or in any way abridged, except for participation in rebellion, or other crime, the basis of representation therein shall be reduced in the proportion which the number of such male citizens shall bear to the whole number of male citizens twenty-one years of age in such State.

Section 3

Disqualification for office; removal of disability.—No person shall be a Senator or Representative in Congress, or elector of President and Vice President, or hold any office, civil or military, under the United States, or under any State, who, having previously taken an oath, as a member of Congress, or as an officer of the United States, or as a member of any State legislature, or as an executive or judicial officer of any State, to support the Constitution of the United States, shall

* Amended by the 20th Amendment, Sections 3 and 4.

have engaged in insurrection or rebellion against the same, or given aid or comfort to the enemies thereof. But Congress may by a vote of two-thirds of each House, remove such disability.

Section 4

Public debt not to be questioned; payment of debts and claims incurred in aid of rebellion forbidden.—The validity of the public debt of the United States, authorized by law, including debts incurred for payment of pensions and bounties for services in suppressing insurrection or rebellion, shall not be questioned. But neither the United States nor any State shall assume or pay any debt or obligation incurred in aid of insurrection or rebellion against the United States, or any claim for the loss or emancipation of any slave; but all such debts, obligations and claims shall be held illegal and void.

Section 5

Congress given power to enforce this article.—The Congress shall have power to enforce, by appropriate legislation, the provisions of this article.

ARTICLE XV

(The proposed amendment was sent to the states Feb. 27, 1869, by the Fortieth Congress. It became effective Mar. 30, 1870.)

Section 1

Right of certain citizens to vote established.—The right of citizens of the United States to vote shall not be denied or abridged by the United States or by any State on account of race, color, or previous condition of servitude.

Section 2

Congress given power to enforce this article.—The Congress shall have power to enforce this article by appropriate legislation.

ARTICLE XVI

(The proposed amendment was sent to the states July 12, 1909, by the Sixty-first Congress. It became effective Feb. 25, 1913.)

Taxes on income; Congress given power to lay and collect.—The Congress shall have power to lay and collect taxes on incomes, from whatever source derived, without apportionment between the several States, and without regard to any census or enumeration.

ARTICLE XVII

(The proposed amendment was sent to the states May 16, 1912, by the Sixty-second Congress. It became effective May 31, 1913.)

Election of United States Senators; filling of vacancies; qualifications of electors.

1. The Senate of the United States shall be composed of two Senators from each State^{*} elected by the people thereof, for

six years; and each Senator shall have one vote. The electors in each State shall have the qualifications requisite for electors of the most numerous branch of the State legislatures.

2. When vacancies happen in the representation of any State in the Senate, the executive authority of such State shall issue writs of election to fill such vacancies: *Provided*, That the legislature of any State may empower the executive thereof to make temporary appointment until the people fill the vacancies by election as the legislature may direct.

3. This amendment shall not be so construed as to affect the election or term of any Senator chosen before it becomes valid as part of the Constitution.

ARTICLE XVIII *

(The proposed amendment was sent to the states Dec. 18, 1917, by the Sixty-fifth Congress. It was approved by three-quarters of the states by Jan. 16, 1919, and became effective Jan. 16, 1920.)

Manufacture, sale or transportation of intoxicating liquors, for beverage purposes, prohibited.—1. After one year from the ratification of this article the manufacture, sale, or transportation of intoxicating liquors within, the importation thereof into, or the exportation thereof from the United States and all territory subject to the jurisdiction thereof for beverage purposes is hereby prohibited.

Congress and the several States given concurrent power to pass appropriate legislation to enforce this article.—2. The Congress and the several States shall have concurrent power to enforce this article by appropriate legislation.

Provisions of article to become operative, when adopted by three-fourths of the States.—3. This article shall be inoperative unless it shall have been ratified as an amendment to the Constitution by the legislatures of the several States, as provided in the Constitution, within seven years from the date of the submission hereof to the States by Congress.

ARTICLE XIX

(The proposed amendment was sent to the states June 4, 1919, by the Sixty-sixth Congress. It became effective Aug. 26, 1920.)

The right of citizens to vote shall not be denied because of sex.—The right of citizens of the United States to vote shall not be denied or abridged by the United States or by any States on account of sex.

Congress shall have power to enforce this article by appropriate legislation.

ARTICLE XX

(The proposed amendment, sometimes called the "Lame Duck Amendment," was sent to the states Mar. 3, 1932, by the Seventy-second Congress. It became effective Feb. 6, 1933; but, in accordance with Section 5, Sections 1 and 2 did not go into effect until Oct. 15, 1933.)

* Repealed by the 21st Amendment.

Section 1

Terms of President, Vice-President, Senators and Representatives.—The terms of the President and Vice-President shall end at noon on the twentieth day of January, and the terms of Senators and Representatives at noon on the third day of January, of the years in which such terms would have ended if this article had not been ratified; and the terms of their successors shall then begin.

Section 2

Time of assembling Congress.—The Congress shall assemble at least once in every year, and such meeting shall begin at noon on the third day of January, unless they shall by law appoint a different day.

Section 3

Filling vacancy in office of President.—If, at the time fixed for the beginning of the term of the President, the President-elect shall have died, the Vice-President-elect shall become President. If a President shall not have been chosen before the time fixed for the beginning of his term, or if the President-elect shall have failed to qualify, then the Vice-President-elect shall act as President until a President shall have qualified; and the Congress may by law provide for the case wherein neither a President-elect nor a Vice-President-elect shall have qualified, declaring who shall then act as President, or the manner in which one who is to act shall be selected, and such person shall act accordingly until a President or Vice-President shall have qualified.

Section 4

Power of Congress in Presidential succession.—The Congress may by law provide for the case of the death of any of the persons from whom the House of Representatives may choose a President whenever the right of choice shall have devolved upon them, and for the case of the death of any of the persons from whom the Senate may choose a Vice-President whenever the right of choice shall have devolved upon them.

Section 5

Time of taking effect.—Sections 1 and 2 shall take effect on the 15th day of October following the ratification of this article.

Section 6

Ratification.—This article shall be inoperative unless it shall have been ratified as an amendment to the Constitution by the legislatures of three-fourths of the

several States within seven years from the date of its submission.

ARTICLE XXI

(The proposed amendment was sent to the states Feb. 20, 1933, by the Seventy-second Congress. It became effective Dec. 5, 1933.)

Section 1

Repeal of Prohibition Amendment.—The eighteenth article of amendment to the Constitution of the United States is hereby repealed.

Section 2

Transportation of intoxicating liquors.—The transportation or importation into any State, Territory, or possession of the United States for delivery or use therein of intoxicating liquors, in violation of the laws thereof, is hereby prohibited.

Section 3

Ratification.—This article shall be inoperative unless it shall have been ratified as an amendment to the Constitution by convention in the several States, as provided in the Constitution, within seven years from the date of the submission thereof to the States by the Congress.

ARTICLE XXII

(The proposed amendment was sent to the states Mar. 21, 1947, by the Eightieth Congress. It became effective Feb. 26, 1951.)

Section 1

Limit to number of terms a President may serve.—No person shall be elected to the office of the President more than twice, and no person who has held the office of President, or acted as President, for more than two years of a term to which some other person was elected President shall be elected to the office of the President more than once. But this Article shall not apply to any person holding the office of President when this Article was proposed by the Congress, and shall not prevent any person who may be holding the office of President, or acting as President, during the term within which this Article becomes operative from holding the office of President or acting as President during the remainder of such term.

Section 2

Ratification.—This article shall be inoperative unless it shall have been ratified as an amendment to the Constitution by the legislatures of three-fourths of the several States within seven years from the date of its submission to the States by the Congress.

Lincoln's Gettysburg Address

The Battle of Gettysburg, one of the most noted battles of the Civil War, was fought on July 1, 2, and 3, 1863. On November 19, 1863, the field was dedicated as a national cemetery by President Lincoln in a two-minute speech that was to become immortal. At the time of its de-

livery the speech was relegated to the inside pages of the papers, while a two-hour address by Edward Everett, the leading orator of the time, caught the headlines.

The following is the text of the address revised by President Lincoln from his own notes:

FOURSCORE and seven years ago our fathers brought forth on this continent a new nation conceived in liberty and dedicated to the proposition that all men are created equal. Now we are engaged in a great civil war testing whether that nation, or any nation so conceived and so dedicated, can long endure. We are met on a great battlefield of that war. We have come to dedicate a portion of that field as a final resting-place for those who here gave their lives that that nation might live. It is altogether fitting and proper that we should do this. But, in a larger sense, we cannot dedicate, we cannot consecrate, we cannot hallow this ground. The brave men, living and dead, who struggled here have consecrated it far above our poor power to add or detract. The world will little note nor long remember what we say here, but it can never forget what they did here. It is for us the living rather to be dedicated here to the unfinished work which they who fought here have thus far so nobly advanced. It is rather for us to be here dedicated to the great task remaining before us—that from these honored dead we take increased devotion to that cause for which they gave the last full measure of devotion—that we here highly resolve that these dead shall not have died in vain, that this nation under God shall have a new birth of freedom, and that government of the people, by the people, for the people shall not perish from the earth.

The Monroe Doctrine

The Monroe Doctrine was announced in President James Monroe's message to Congress, during his second term on December 2, 1823 in part as follows:

"In the discussions to which this interest has given rise, and in the arrangements by which they may terminate, the occasion has been deemed proper for asserting as a principle in which rights and interests of the United States are involved, that the American continents, by the free and independent condition which they have assumed and maintain, are henceforth not to be considered as subjects for future colonization by any European power. . . . We owe it, therefore, to candor and to the amicable relations existing between the United States and those powers to declare that we should consider any attempt on their part to extend their system to any portion of this hemisphere as dangerous to our peace and safety. With the existing colonies or dependencies of any European power we have not interfered and shall not interfere. But with the governments who have declared their independence and maintain it, and whose independence we have, on great consideration, and on just principles, acknowledged, we could not view any interposition for the purpose of oppressing them or controlling in any other manner their destiny by any European power in any other light than as the manifestation of an unfriendly disposition toward the United States."

Minority Presidents

Thirteen candidates have become President of the U. S. with a popular vote less than 50 per cent of the total vote cast. It should be noted, however, that in elections before 1872, presidential electors were not chosen by popular vote in all states. Adams' election in 1824 was by the House of Representatives, which chose him over Jackson, who had a plurality of both electoral and popular votes, but not a majority in the electoral college.

Besides Jackson in 1824, only two other candidates receiving the largest popular vote have failed to gain a majority in the electoral college—Samuel J. Tilden (D) in 1876 and Grover Cleveland (D) in 1888.

The "minority" Presidents follow:

Year	President	Elec- toral	Popular vote
		Pct.	Pct.
1824	John Q. Adams.....	31.8	29.8
1844	James K. Polk (D).....	61.8	49.3
1848	Zachary Taylor (W).....	56.2	47.3
1856	James Buchanan (D).....	58.7	45.3
1860	Abraham Lincoln (R).....	59.4	39.9
1876	Rutherford B. Hayes (R).....	50.1	47.9
1880	James A. Garfield (R).....	57.9	48.3
1884	Grover Cleveland (D).....	54.6	48.8
1888	Benjamin Harrison (R).....	58.1	47.8
1892	Grover Cleveland (D).....	62.4	46.0
1912	Woodrow Wilson (D).....	81.9	41.8
1916	Woodrow Wilson (D).....	52.1	49.3
1948	Harry S. Truman (D).....	57.1	49.5

The Mayflower Compact

On September 6, 1620, the *Mayflower*, a sailing vessel of about 180 tons, started her memorable voyage from Plymouth, England with about 100* pilgrims aboard, bound for Virginia to establish a private permanent colony in North America. Arriving at Provincetown, Mass., on November 11 (November 21, new style calendar),

forty-one of the passengers signed the famous "Mayflower Compact" as the boat lay at anchor in that Cape Cod harbor. A small detail of the pilgrims, led by William Bradford, assigned to select a place for permanent settlement landed at what is now Plymouth, Mass., on December 21, N.S.

The text of the compact follows:

IN THE NAME OF GOD, Amen. We, whose names are underwritten, the Loyal Subjects of our dread Sovereign Lord, King James, by the Grace of God, of Great Britain, France and Ireland, King, Defender of the Faith, &

Having undertaken for the Glory of God, and Advancement of the Christian Faith, and the Honour of our King and Country, a voyage to plant the first colony in the northern Parts of Virginia; do by these Presents, solemnly and mutually in the Presence of God and one of another, covenant and combine ourselves together into a civil Body Politick, for our better Ordering and Preservation, and Furtherance of the Ends aforesaid; And by Virtue hereof to enact, constitute, and frame, such just and equal Laws, Ordinances, Acts, Constitutions and Offices, from time to time, as shall be thought most meet and convenient for the General good of the Colony; unto which we promise all due Submission and Obedience.

In WITNESS whereof we have hereunto subscribed our names at Cape Cod the eleventh of November, in the Reign of our Sovereign Lord, King James of England, France and Ireland, the eighteenth, and of Scotland the fifty-fourth. Anno Domini, 1620

* Historians differ as to whether 100, 101, or 102 passengers were aboard.

The Early Congresses

At the urging of Massachusetts and Virginia, the First Continental Congress met in Philadelphia on September 5, 1774, and was attended by representatives of all the colonies except Georgia. Patrick Henry of Virginia declared: "The distinctions between Pennsylvanians, New Yorkers and New Englanders are no more. I am not a Virginian but an American." This Congress, which adjourned October 26, 1774, passed intercolonial resolutions calling for extensive boycott by the colonies against British trade.

The following year, most of the delegates from the colonies were chosen by popular election to attend the Second Continental Congress, which assembled in Philadelphia on May 10. As war had already begun between the colonies and England, the chief problems before the Congress were the procuring of military supplies, the establishment of an army and proper defenses, the issuing of continental bills of credit, etc. On June 15, 1775, George Washington

was elected to command the Continental army. Congress adjourned Dec. 12, 1776.

Other Continental Congresses were held in Baltimore (1776-77), Philadelphia (1777), Lancaster, Pa. (1777), York, Pa. (1777-78) and Philadelphia (1778-81).

In 1781, the Articles of Confederation, although establishing a league of the thirteen states rather than a strong central government, provided for the continuance of Congress. Known thereafter as the Congress of the Confederation, it held sessions in Philadelphia (1781-83), Princeton, N. J. (1783), Annapolis, Md. (1783-84) and Trenton, N. J. (1784). Five sessions were held in New York City between the years 1785 and 1789.

The Congress of the United States, established by the ratification of the Constitution, held its first meeting on Mar. 4, 1789, in New York City. Several sessions of Congress were held in Philadelphia, and the first meeting in Washington, D. C., was on Nov. 17, 1800.

Presidents of the Continental Congresses

Name	Elected	Born	Died
Peyton Randolph, Va.	Sept. 5, 1774	c.1721	1775
Henry Middleton, S. C.	Oct. 22, 1774	1717	1784

* Resigned May 29, 1786, never having served, because of continued illness.

The Star-Spangled Banner

Francis Scott Key, 1814

O say, can you see, by the dawn's early light,
 What so proudly we hail'd at the twilight's last gleaming?
 Whose broad stripes and bright stars, thro' the perilous fight,
 O'er the ramparts we watch'd, were so gallantly streaming?
 And the rockets' red glare, the bombs bursting in air,
 Gave proof thro' the night that our flag was still there.
 O say, does that star-spangled banner yet wave
 O'er the land of the free and the home of the brave?

On the shore dimly seen thro' the mists of the deep,
 Where the foe's haughty host in dread silence reposes,
 What is that which the breeze, o'er the towering steep,
 As it fitfully blows, half conceals, half discloses?
 Now it catches the gleam of the morning's first beam,
 In full glory reflected, now shines on the stream:
 'T is the star-spangled banner: O, long may it wave
 O'er the land of the free and the home of the brave!

And where is that band who so vauntingly swore
 That the havoc of war and the battle's confusion,
 A home and a country should leave us no more?
 Their blood has wash'd out their foul footsteps' pollution.
 No refuge could save the hireling and slave
 From the terror of flight or the gloom of the grave:
 And the star-spangled banner in triumph doth wave
 O'er the land of the free and the home of the brave.

O thus be it ever when free-men shall stand
 Between their lov'd home and the war's desolation;
 Blest with vict'ry and peace, may the heav'n-rescued land
 Praise the Pow'r that hath made and preserv'd us a nation!
 Then conquer we must, when our cause it is just,
 And this be our motto: "In God is our trust!"
 And the star-spangled banner in triumph shall wave
 O'er the land of the free and the home of the brave!

ON SEPTEMBER 13, 1814, Francis Scott Key visited the British fleet in Chesapeake Bay to secure the release of Dr. William Beanes, who had been captured after the burning of Washington, D. C. The release was secured, but Key was detained on ship overnight during the shelling of Fort McHenry, one of the forts defending Baltimore. In the morning, he was so delighted to see the American flag still flying over the fort that he began a poem to commemorate the occasion. Entitled "The Star-Spangled Banner," the poem soon attained wide popularity as sung to the tune "Anacreon in Heaven." The origin of this tune is obscure, but it may have been written by John Stafford Smith, a British composer born in 1750. "The Star-Spangled Banner" was officially made the National Anthem by Congress in 1931, although already adopted as such by the Army and Navy.

History of the Flag

Source: *Encyclopaedia Britannica.*

THE FIRST OFFICIAL AMERICAN flag, the Continental or Grand Union flag, was displayed on Prospect Hill, Jan. 1, 1776, in the American lines besieging Boston. It had thirteen alternate red and white stripes, with the British Union Jack in the upper left corner.

On June 14, 1777, the Continental Congress adopted the design for a new flag, which actually was the Continental flag with the red cross of St. George and the white cross of St. Andrew replaced on the blue field by thirteen stars, one for each state. No rule was made as to the arrangement of the stars, and while they were usually shown in a circle, there were various other designs. It is uncertain when the new flag was first flown, but its first official announcement is believed to have been on Sept. 3, 1777.

The first public assertion that Betsy Ross made the first Stars and Stripes appeared in a paper read before the Historical Society of Pennsylvania on March 14, 1870, by William J. Canby, a grandson. However, Mr. Canby on later investigation found no official documents of any action by Congress on the flag before June 14, 1777. Betsy Ross' own story, according to her daughter, was that Washington, Robert Morris and George Ross, as representatives of Congress, visited her in Philadelphia in June 1776, showing her a rough draft of the flag and asking her if she could make one. However, the only actual record of the manufacture of flags by Betsy Ross is a voucher in Harrisburg, Pa., for 14 pounds

and some shillings for flags for the Pennsylvania navy.

On Jan. 13, 1794, Congress voted to add two stars and two stripes to the flag in recognition of the admission of Vermont and Kentucky to the Union. By 1818, there were twenty states in the Union, and as it was obvious that the flag would soon become unwieldy, Congress voted April 18 to return to the original thirteen stripes and to indicate the admission of a new state simply by the addition of a star the following July 4. The last two stars were added July 4, 1912, for New Mexico and Arizona.

The first Confederate flag, adopted in 1861 by the Confederate convention in Montgomery, Ala., was called the Stars and Bars; but because of its similarity in colors to the American flag, there was much confusion in the Battle of Bull Run. To remedy this situation, Gen. G. T. Beauregard suggested a battle flag, which was used by the Southern armies throughout the war. The flag consisted of a red field on which was placed a blue cross of St. Andrew separated from the field by a white fillet and adorned with thirteen* white stars for the Confederate states. In May 1863, at Richmond, an official flag was adopted by the Confederate Congress. This flag was white and twice as long as wide; the union, two-thirds the width of the flag, contained the battle flag designed for Gen. Beauregard. A broad transverse stripe of red was added Feb. 4, 1865, so that the flag might not be mistaken for a signal of truce.

* 11 states formally seceded, and unofficial groups in Kentucky and Missouri adopted ordinances of secession. On this basis, these two states were admitted to the Confederacy, although the official state governments remained in the Union.

Flag Etiquette

(Public Law 829—77th Congress)

JOINT RESOLUTION

To amend Public Law Numbered 623, approved June 22, 1942, entitled "Joint resolution to codify and emphasize existing rules and customs pertaining to the display and use of the flag of the United States of America."

Resolved by the Senate and House of Representatives of the United States of America in Congress Assembled, That Public Law Numbered 623, approved June 22, 1942, entitled "Joint resolution to codify and emphasize existing rules and customs pertaining to the display and use of the flag of the United States of America," be, and the same is hereby amended to read as follows:

That the following codification of existing rules and customs pertaining to the display and use of the flag of the United States of America be, and it is hereby established for the use of such civilians or civilian groups or organizations as may

not be required to conform with regulations promulgated by one or more executive departments of the Government of the United States.

SEC. 2. (a) It is the universal custom to display the flag only from sunrise to sunset on buildings and on stationary flag-staffs in the open. However, the flag may be displayed at night upon special occasions when it is desired to produce a patriotic effect.

(b) The flag should be hoisted briskly and lowered ceremoniously.

(c) The flag should not be displayed on days when the weather is inclement.

(d) The flag should be displayed on all days when the weather permits, especially on New Year's Day, January 1; Inauguration Day, January 20; Lincoln's Birthday, February 12; Washington's Birthday, Feb-

ruary 22; Army Day*, April 6; Easter Sunday (variable); Mother's Day, second Sunday in May; Memorial Day (half-staff until noon), May 30; Flag Day, June 14; Independence Day, July 4; Labor Day, first Monday in September; Constitution Day, September 17; Columbus Day, October 12; Navy Day*, October 27; Armistice Day, November 11†; Thanksgiving Day, fourth Thursday in November; Christmas Day, December 25; such other days as may be proclaimed by the President of the United States; the birthdays of States (dates of admission); and on State holidays.

(e) The flag should be displayed daily, weather permitting, on or near the main administration building of every public institution.

(f) The flag should be displayed in or near every polling place on election days.

(g) The flag should be displayed during school days in or near every schoolhouse.

Sec. 3. That the flag, when carried in a procession with another flag or flags, should be either on the marching right; that is, the flag's own right, or, if there is a line of other flags, in front of the center of that line.

(a) The flag should not be displayed on a float in a parade except from a staff, or as provided in subsection (i).

(b) The flag should not be draped over the hood, top, sides, or back of a vehicle or of a railroad train or a boat. When the flag is displayed on a motorcar, the staff shall be fixed firmly to the chassis or clamped to the radiator cap.

(c) No other flag or pennant should be placed above or, if on the same level, to the right of the flag of the United States of America, except during church services conducted by naval chaplains at sea, when the church pennant may be flown above the flag during church services for the personnel of the Navy.

(d) The flag of the United States of America, when it is displayed with another flag against a wall from crossed staffs, should be on the right, the flag's own right, and its staff should be in front of the staff of the other flag.

(e) The flag of the United States of America should be at the center and at the highest point of the group when a number of flags of States or localities or pennants of societies are grouped and displayed from staffs.

(f) When flags of States, cities, or localities, or pennants of societies are flown on the same halyard with the flag of the United States, the latter should always be at the peak. When the flags are flown from adjacent staffs, the flag of the United States should be hoisted first and lowered last. No such flag or pennant may be placed

above the flag of the United States or to the right of the flag of the United States.

(g) When flags of two or more nations are displayed, they are to be flown from separate staffs of the same height. The flags should be of approximately equal size. International usage forbids the display of the flag of one nation above that of another nation in time of peace.

(h) When the flag of the United States is displayed from a staff projecting horizontally or at an angle from the window sill, balcony, or front of a building, the union of the flag should be placed at the peak of the staff unless the flag is at half-staff. When the flag is suspended over a sidewalk from a rope extending from a house to a pole at the edge of the sidewalk, the flag should be hoisted out, union first, from the building.

(i) When the flag is displayed otherwise than by being flown from a staff, it should be displayed flat, whether indoors or out, or so suspended that its folds fall as free as though the flag were staffed.

(j) When the flag is displayed over the middle of the street, it should be suspended vertically with the union to the north in an east and west street or to the east in a north and south street.

(k) When used on a speaker's platform, the flag, if displayed flat, should be displayed above and behind the speaker. When displayed from a staff in a church or public auditorium, if it is displayed in the chancel of a church, or on the speaker's platform in a public auditorium, the flag should occupy the position of honor and be placed at the clergyman's or speaker's right as he faces the congregation or audience. Any other flag so displayed in the chancel or on the platform should be placed at the clergyman's or speaker's left as he faces the congregation or audience. But when the flag is displayed from a staff in a church or public auditorium elsewhere than in the chancel or on the platform it shall be placed in the position of honor at the right of the congregation or audience as they face the chancel or platform. Any other flag so displayed should be placed on the left of the congregation or audience as they face the chancel or platform.

(l) The flag should form a distinctive feature of the ceremony of unveiling a statue or monument, but it should never be used as the covering for the statue or monument.

(m) The flag, when flown at half-staff, should be first hoisted to the peak for an instant and then lowered to the half-staff position. The flag should be again raised to the peak before it is lowered for the day. By "half-staff" is meant lowering the flag to one-half the distance between the top and bottom of the staff. Crepe streamers may be affixed to spearheads or flag-staffs in a parade only by order of the President of the United States.

* In 1949, Army Day and Navy Day were abandoned; Armed Forces Day is celebrated the 3rd Saturday of May. † In 1954, changed to Veterans Day.

(n) When the flag is used to cover a casket, it should be so placed that the union is at the head and over the left shoulder. The flag should not be lowered into the grave or allowed to touch the ground.

SEC. 4. That no disrespect should be shown to the flag of the United States of America, the flag should not be dipped to any person or thing. Regimental colors, State flags, and organization or institutional flags are to be dipped as a mark of honor.

(a) The flag should never be displayed with the union down save as a signal of dire distress.

(b) The flag should never touch anything beneath it, such as the ground, the floor, water, or merchandise.

(c) The flag should never be carried flat or horizontally, but always aloft and free.

(d) The flag should never be used as drapery of any sort whatsoever, never festooned, drawn back, nor up, in folds, but always allowed to fall free. Bunting of blue, white, and red, always arranged with the blue above, the white in the middle, and the red below, should be used for covering a speaker's desk, draping the front of a platform, and for decoration in general.

(e) The flag should never be fastened, displayed, used, or stored in such a manner as will permit it to be easily torn, soiled, or damaged in any way.

(f) The flag should never be used as a covering for a ceiling.

(g) The flag should never have placed upon it, nor on any part of it, nor attached to it any mark, insignia, letter, word, figure, design, picture, or drawing of any nature.

(h) The flag should never be used as a receptacle for receiving, holding, carrying, or delivering anything.

(i) The flag should never be used for advertising purposes in any manner whatsoever. It should not be embroidered on such articles as cushions or handkerchiefs and the like, printed or otherwise impressed on paper napkins or boxes or anything that is designed for temporary use and discard; or used as any portion of a costume or athletic uniform. Advertising signs should not be fastened to a staff or halyard from which the flag is flown.

(j) The flag, when it is in such condition that it is no longer a fitting emblem for display, should be destroyed in a dignified way, preferably by burning.

SEC. 5. That during the ceremony of hoisting or lowering the flag or when the flag is passing in a parade or in a review, all persons present should face the flag,

stand at attention, and salute. Those present in uniform should render the military salute. When not in uniform, men should remove the headdress with the right hand holding it at the left shoulder, the hand being over the heart. Men without hats should salute in the same manner. Aliens should stand at attention. Women should salute by placing the right hand over the heart. The salute to the flag in the moving column should be rendered at the moment the flag passes.

SEC. 6. That when the national anthem is played and the flag is not displayed, all present should stand and face toward the music. Those in uniform should salute at the first note of the anthem, retaining this position until the last note. All others should stand at attention, men removing the headdress. When the flag is displayed, all present should face the flag and salute.

SEC. 7. That the pledge of allegiance to the flag, "I pledge allegiance to the flag of the United States of America and to the Republic for which it stands, one Nation under God,[†] indivisible, with liberty and justice for all," be rendered by standing with the right hand over the heart. However, civilians will always show full respect to the flag when the pledge is given by merely standing at attention, men removing the headdress. Persons in uniform shall render the military salute.

SEC. 8. Any rule or custom pertaining to the display of the flag of the United States of America, set forth herein, may be altered, modified, or repealed, or additional rules with respect thereto may be prescribed, by the Commander-in-Chief of the Army and Navy of the United States, whenever he deems it to be appropriate or desirable; and any such alteration or additional rule shall be set forth in a proclamation.

Approved, December 22, 1942.

The American's Creed*

"I believe in the United States of America as a government of the people, by the people, for the people; whose just powers are derived from the consent of the governed; a democracy in a republic; a sovereign Nation of many sovereign States; a perfect union, one and inseparable; established upon those principles of freedom, equality, justice, and humanity for which American patriots sacrificed their lives and fortunes.

"I therefore believe it is my duty to my country to love it; to support its Constitution; to obey its laws; to respect its flag, and to defend it against all enemies."

* William Tyler Page, Clerk of the U. S. H. use of Representatives, wrote "The American's Creed" in 1917. It was accepted by the House on behalf of the American people on April 3, 1918. † The idea originated in 1892 with James B. Upham, an editor of *Youth's Companion*. The claim that Upham was also the author is disputed by some who credit Francis Bellamy. ‡ The phrase "under God" was added to the pledge on June 14, 1954.

SCIENCE

MEASURES AND WEIGHTS

UNITS OF LENGTH

Metric System

The meter was originally intended to be one ten-millionth of the earth's quadrant, a quadrant being one-quarter of a circumference. However, because of the difficulty of determining such a length with accuracy, this definition was abandoned. The meter is now considered to be the distance at 0°C between two microscopic marks on the International Prototype Meter, a platinum-iridium bar, kept by the International Bureau of Weights and Measures at Sèvres, France, a suburb of Paris.

In 1927, the International Conference on Weights and Measures adopted a secondary definition of the meter in terms of light-waves. According to this definition, one meter is equivalent to 1,553,164.13 wave lengths of the red light from cadmium.

Unit	Comparison	English equivalent
Millimeter (mm)	.001 meter	.0394 inch
Centimeter (cm)	.01 meter	.3937 inch

Dekameter (dkm)	10 meters	32.8083 feet
Hectometer (hm)	100 meters	328.0833 feet
Kilometer (km)	1000 meters	.62137 mile

English System

According to legend, the yard was established by Henry I as the distance from the point of his nose to the end of his thumb when his arm was outstretched. The British Imperial Yard was defined in 1878 by the Weights and Measures Act as the distance at 62°F between two fine lines on gold studs sunk in a bronze bar known as the "No. 1 Standard Yard." This is equivalent to .914399 meter. In the United States, the yard is defined in terms of the meter, using as a standard the U. S. Prototype Meter. According to this definition, the yard is 3600/3937 (or .914402) meter, slightly longer than the British Imperial Yard.

UNITS OF WEIGHT OR MASS

The term *mass* denotes the amount of matter contained in an object, while the term *weight* denotes the gravitational pull of the earth on the object. For practical purposes, the two terms are synonymous.

Metric System

The gram was originally intended to be equal to the mass of one cubic centimeter of pure water at 4°C. However, because of

the difficulty of making exact measurement, a small error was made; and it has since been found that a kilogram of pure water occupies 1.000028 cubic decimeters. The standard for the kilogram is a platinum-iridium cylinder, called the International Prototype Kilogram, which is kept at the International Bureau of Weights and Measures in France.

Unit	Comparison	Avdp.	English equivalents

Metric ton (t)	1000 kg	1.1023 tons *		

* Short tons. A metric ton is equivalent to .9842 long ton.

English System

The English System is complicated by the existence of three different kinds of weight: *avoirdupois weight*, used for common purposes; *troy weight*, used for weighing gold, silver, etc.; and *apothecaries weight*, used for making up medical prescriptions.

The British Imperial Pound (avoirdupois) is defined as the mass of a pure plati-

num cylinder kept by the Standards Department of the Board of Trade. In the United States, the pound (avoirdupois) is defined in terms of the kilogram, using as a standard the U. S. Prototype Kilogram. According to this definition, the pound is equal to .4535924277 kilogram, making it infinitesimally smaller than the British Imperial Pound.

UNITS OF CAPACITY

Metric System

The liter is a secondary unit of capacity defined as the volume occupied by one kilogram of pure water at 4°C. It was intended that the liter should exactly equal one cubic decimeter, but as an error was made in measurement, has since been found to equal 1.000028 cubic decimeters.

Unit	Comparison	English equivalents	
		Liquid	Dry
Milliliter (ml)	.001 liter	.0338 fl oz	.0018 pt
Centiliter (cl)	.01 liter	.3381 fl oz	.0182 pt

Dekaliter (dkl)	10 liters	2.6418 gal	1.1351 pk
Hectoliter (hl)	100 liters	26.4178 gal	2.8378 bu

English System

In Great Britain, the standard unit of capacity for measuring both liquid and dry commodities is the British Imperial Gallon. It is defined as the volume of ten pounds of pure water at 62°F and contains 277.418 cubic inches. The bushel is defined as eight gallons (2218.192 cubic inches).

In the United States, there are two separate standards. The unit for measuring liquids is the gallon, which is defined as 231 cubic inches; the unit for measuring dry commodities is the bushel, which is defined as 2150.42 cubic inches.

COMMON FORMULAS

Circumference

Circle: $C=\pi d$, in which π is 3.1416 and d the diameter.

Area

Triangle: $A=\frac{ab}{2}$, in which a is the base and b the height.

Square: $A=a^2$, in which a is one of the sides.

Rectangle: $A=ab$, in which a is the base and b the height.

Trapezoid: $A=\frac{h(a+b)}{2}$, in which h is the height, a the longer parallel side, and b the shorter.

Regular pentagon: $A=1.720a^2$, in which a is one of the sides.

Regular hexagon: $A=2.598a^2$, in which a is one of the sides.

Regular octagon: $A=4.828a^2$, in which a is one of the sides.

Circle: $A=\pi r^2$, in which π is 3.1416 and r the radius.

Volume

Cube: $V=a^3$, in which a is one of the edges.
Rectangular prism: $V=abc$, in which a is the length, b the width, and c the depth.

Pyramid: $V=\frac{Ah}{3}$, in which A is the area of the base and h the height.

Cylinder: $V=\pi r^2h$, in which π is 3.1416, r the radius of the base, and h the height.

Cone: $V=\frac{\pi r^2h}{3}$, in which π is 3.1416, r the radius of the base, and h the height.

Sphere: $V=\frac{4\pi r^3}{3}$, in which π is 3.1416 and r the radius.

Miscellaneous

Speed per second acquired by falling body: $v=32t$, in which t is the time in seconds.

Distance in feet traveled by falling body: $d=16t^2$, in which t is the time in seconds.

Speed of sound in feet per second through any given temperature of air:

$V=\frac{1087\sqrt{273+t}}{16.52}$, in which t is the temperature Centigrade.

Cost per hour of operation of electrical device: $C=\frac{Wtc}{1000}$, in which W is the number of watts, t the time in hours, and c the cost per kilowatt-hour.

Conversion of matter into energy (Einstein's Theorem): $E=mc^2$, in which E is the energy in ergs, m the mass of the matter in grams, and c the speed of light in centimeters per second. ($c^2=9\cdot10^{20}$).

Abbreviations

The National Bureau of Standards recommends that the period be omitted after all abbreviations of units unless the

abbreviation forms an English word, and that the same abbreviation be used for both singular and plural.

FAHRENHEIT AND CENTIGRADE SCALES

Zero on the Fahrenheit scale represents the temperature produced by the mixing of equal weights of snow and common salt.

Absolute zero is theoretically the lowest possible temperature, the point at which all molecular motion would cease.

	F	C	
Boiling point of water	212°	100°	To convert Fahrenheit to Centigrade, subtract 32 and multiply by 5/9.
Freezing point of water	32°	0°	
Absolute zero	-459.6°	-273.1°	To convert Centigrade to Fahrenheit, multiply by 9/5 and add 32.

ROMAN NUMERALS

Roman numerals are expressed by letters of the alphabet and are rarely used today except for formality or variety.

There are three basic principles for reading Roman numerals:

1. A letter repeated once or twice repeats its value that many times. (XXX=30, CC=200, etc.).
2. One or more letters placed after another letter of greater value increases the greater value by the amount of the smaller. (VI=6, LXX=70, MCC=1200, etc.).
3. A letter placed before another letter of greater value decreases the greater value by the amount of the smaller. (IV=4, XC=90, CM=900, etc.).

Letter	Value	Letter	Value
I	1	LX	60
II	2	LXX	70
III	3	LXXX	80
IV	4	XC	90
V	5	C	100
VI	6	D	500
VII	7	M	1,000
VIII	8	V̄	5,000
IX	9	X̄	10,000
X	10	L̄	50,000
XX	20	C̄	100,000
XXX	30	D̄	500,000
XL	40	M̄	1,000,000
L	50		

SIMPLE INTEREST FOR \$100

To find the interest for any amount of money, move the decimal point of that amount two places to the left and multiply by the figure obtained from the table.

For figuring simple interest, the year is considered to have 360 days.

	1 Day	7 Days	1 Month	3 Months	6 Months	1 Year

MISCELLANEOUS UNITS

AGATE: Originally a measurement of type size (5½ points). Now equal to 1/14 inch. Used in printing for measuring column length.

ANGSTROM (A or λ): .0001 micron or .0000001 mm. Used for measuring length of light waves.

ASTRONOMICAL UNIT (A.U.): 93,003,000 miles, the average distance of the earth from the sun. Used in astronomy.

BALE: A large bundle of goods. In the U. S., the approximate weight of a bale of cotton is 500 pounds. The weight varies in other countries.

BARREL (bbl): For liquids, 31½ gallons or 7326.5 cubic inches. For dry commodities, except cranberries: 105 dry quarts or 7056 cubic inches. For cranberries: 5826 cubic inches.

BOARD FOOT (fbm): 144 cubic inches (12 in. x 12 in. x 1 in.). Used for lumber.

BOLT: 40 yards. Used for measuring cloth.

CABLE: About 100 fathoms or 600 feet. Used for measuring lengths of cable.

CARAT (c): 200 milligrams or 3.086 grains troy. Originally the weight of a seed of the carob tree in the Mediterranean region. Used for weighing precious stones. Also a measure of the purity of gold alloy, indicating how many parts out of 24 are pure. Eighteen carat gold, for example, is ¾ pure.

CHAIN (ch): a chain 66 feet or one-tenth of a furlong in length, divided into 100 parts called links. One mile is equal to 80 chains. Used in surveying and sometimes called Gunter's chain.

CUBIT: 18 inches or 45.72 cm. Derived from distance between elbow and tip of middle finger.

ELL, ENGLISH: 1¼ yards or 1/32 bolt. Used for measuring cloth.

FATHOM (fath): 6 feet or 1.8288 m. Derived from the distance to which a man can stretch his arms. Used for measuring cables and depths of water.

FREIGHT TON (also called MEASURE-MENT TON): 40 cubic feet of merchandise. Used for cargo freight.

GREAT GROSS: 12 gross or 1728.

GROSS: 12 dozen or 144.

HAND: 4 inches or 10.16 cm. Derived from the width of the hand. Used for measuring the height of horses at withers.

HOGSHEAD (hhd): 2 liquid barrels or 14.653 cubic inches.

HORSEPOWER: The power needed to lift 33,000 pounds a distance of one foot in one minute (about 1½ times the power an average horse can exert). Used for measuring the power of steam engines, etc.

KNOT: Not a distance, but the rate of speed of one nautical mile per hour. Used for measuring speed of ships.

LEAGUE: Rather indefinite and varying measure, but usually estimated at 3 miles in English-speaking countries.

LIGHT-YEAR: 5,880,000,000,000 miles, the distance light travels in a year at the rate of 186,272 miles per second. (If an astronomical unit were represented by one inch, a light-year would be represented by about one mile.) Used for measurements in interstellar space.

LINK: One-hundredth of a chain or 7.92 inches. Used in surveying.

MAGNUM: Two-quart bottle. Used for measuring wine, etc.

MICRON (μ): .001 millimeter. Used for scientific measurements.

MIL: .001 inch. Used for measuring size of wire. The area of a cross-section of wire is usually expressed in circular mils, a circular mil being the area of a circle one mil in diameter. A wire one inch in diameter has a cross-section area of one million circular mils.

MILLIMICRON (mμ): .001 micron or .000001 mm. Used for scientific measurements.

NAUTICAL MILE (also called GEOGRAPHICAL or SEA MILE): Equal to a minute or 1/21600 of a great circle of the earth. Length varies in different countries. In Great Britain, it is 6080 feet or 1853.2 meters, and in the United States, it is 6080.2 feet or 1853.248 meters. The International Hydrographic Bureau proposed in 1929 a length of 1852 meters or 6076.097 feet, which has been adopted by several countries.

PARSEC: Approximately 3.26 light-years or 19.2 trillion miles. Term is combination of first syllables of *parallax* and *second*, and distance is that of imaginary star when lines drawn from it to both earth and sun form a maximum angle or parallax of one second (1/3600 degree). Used for measuring interstellar distances.

PI (π): 3.14159265+. The ratio of the circumference of a circle to its diameter. For practical purpose, the value is used to four decimal places: 3.1416.

PICA: ½ inch or 12 points. Used in printing for measuring column width, etc.

PIPE: 2 hogsheads. Used for measuring wine and other liquids.

POINT: .013837 (approximately 1/72) inch or 1/12 pica. Used in printing for measuring type size.

QUINTAL: 100,000 grams or 220.46 pounds avoirdupois.

QUIRE: Used for measuring paper. Sometimes 24 sheets but more often 25. There are 20 quires in a ream.

REAM: Used for measuring paper. Sometimes 480 sheets, but more often 500 sheets.

SCORE: 20 units.

SPAN: 9 inches or 22.86 cm. Derived from the distance between the end of the thumb and the end of the little finger when both are outstretched.

STONE: Legally 14 pounds avoirdupois in Great Britain.

TOWNSHIP: U. S. land measurement of almost 36 square miles. The south border is 6 miles long. The east and west borders, also 6 miles long, follow the meridians, making the north border slightly less than six miles long. Used in surveying.

TUN: 252 gallons, but often larger. Used for measuring wine and other liquids

Mean and Median

The mean, also called the average, of a series of quantities is obtained by finding the sum of the quantities and dividing it by the number of quantities. In the series 1,3,5,18,19,20,25, the mean or average is 13 —i.e., 91 divided by 7.

The median of a series is that point which so divides it that half the quantities are on one side, half on the other. In the above series, the median is 18.

The median often better expresses the common-run, since it is not, as is the mean, affected by an excessively high or low figure. In the series 1,3,4,7,55, the median of 4 is a truer expression of the common-run than is the mean of 14.

¹ R—raw; C—cooked. ² Cooked short time in small amount of water. ³ Boneless. ⁴ 4% nonfat milk solids. ⁵ Year-round average. ⁶ Made from skim milk. ⁷ Bone out. Vitamin values based on muscle meat only. ⁸ Based on yellow corn; white corn contains only a trace. ⁹ Patent. ¹⁰ Vitamin A added. ¹¹ Meat only. ¹² If very pale varieties only were used, value would be much lower. ¹³ Milk added. ¹⁴ No sugar added. ¹⁵ Data assume cut to be prepared by braising or pot roasting. Use of proportionate quantity of drippings would add approximately 50% more thiamine and niacin and 25% more riboflavin.

NOTE: Parentheses denote imputed values. The sign ... shows that no basis could be found for imputing a value although there was some reason to believe that a measurable amount might be present.

* Mass number of the isotope of longest known half-life.

† Isotopes are different forms of the same element, having the same atomic number but different atomic weights. The number of isotopes given includes only those that are stable and natural occurring, excluding those marked ††.

‡ Liquid. § Amorphous. ¶ Graphite. ** Crystalline. †† Compressed. ‡‡ Cast. §§ Exact date doubtful—born 1193 and died 1280. ††† Have been artificially produced. *** New name adopted by International Union of Chemistry, replacing old name in parentheses. < Is less than. > Is greater than.

Figures in parentheses are tentative or theoretical.

The number of isotopes of each element is increased by discovery or by manufacture.

Scientific Inventions, Discoveries and Theories

Inventions

- Adding machine, recording: William S. Burroughs, 1888.
- Airplane: Wilbur and Orville Wright, 1903.
- Air brake, railroad: George Westinghouse, 1868.
- Air pump: Otto von Guericke, 1650.
- Automobile: (Product of inventions of many men. Gottlieb Daimler is frequently given credit, c.1887.)
- Bakelite: Leo H. Baekeland, 1908.
- Balloon, hot-air: Joseph and Jacques Montgolfier, 1783.
- Barometer: Evangelista Torricelli, 1643.
- Camera, Kodak: George Eastman, 1888.
- Carburetor, spray: Charles E. Duryea, 1892.
- Cellophane: J. E. Brandenberger, 1911.
- Celluloid: John W. and I. S. Hyatt, 1870.
- Clock, pendulum: Christiaan Huygens, 1656.
- Converter, Bessemer: William Kelly, 1851. (Patent bought by Sir Henry Bessemer, who made a similar invention in 1856.)
- Cotton gin: Eli Whitney, 1793.
- Cyanide: Nikodem Caro and Adolf Frank, 1905.
- Cyclotron: Ernest O. Lawrence, 1931.
- Daguerreotype process: Louis J. M. Daguerre, 1839.
- Diesel engine: Rudolf Diesel, 1897.
- Dynamite: Alfred B. Nobel, 1862.
- Dynamo: Michael Faraday, 1831.
- Dynamo, industrial: Zénobe Gramme, 1872.
- Electromagnet: William Sturgeon, 1823.
- Electroplating: Luigi Brugnatelli, 1805.
- Elevator, passenger: Elisha G. Otis, 1857.
- Elevator safety device: Elisha G. Otis, 1852.
- Engine, high-speed internal-combustion: Gottlieb Daimler, 1885.
- Filament, tungsten: Irving Langmuir, 1915.
- Flying shuttle: John Kay, 1733.
- Food preservation, hermetically sealed (meat): François (Nicolas) Appert, 1810, with little success.
- Fountain pen: Lewis E. Waterman, 1884. (First successful one.)
- Frequency modulation (FM): Edwin H. Armstrong, 1933.
- Guncotton: Christian Schönbein, 1845.
- Gyrocompass: Elmer A. Sperry, 1905.
- Gyroscope: Léon Foucault, 1852.
- Helicopter: Igor I. Sikorsky, 1909; Louis C. Bréguet equipped first passenger carrying helicopter, 1909; first successful modern helicopter, Heinrich K. J. Focke, 1937-41.
- Hydroplane: Charles M. Ramus propounded idea around 1870; Glenn H. Curtiss, 1911.
- Jet propulsion (aircraft): Sir Frank Whittle, 1930.
- Lamp, electric incandescent: (Inventor uncertain; Thomas A. Edison, who made a lamp in 1879, is sometimes credited.)
- Lens, bifocal: Benjamin Franklin, c.1760.
- Lightning rod: Benjamin Franklin, 1752.
- Linotype machine: Ottmar Mergenthaler, 1885 (patent); first used, 1886.
- Lithography: Aloys Senefelder, 1796.
- Machine gun: Richard J. Gatling, 1861.
- Match, friction: John Walker, 1827.
- Mercury-vapor lamp: Peter C. Hewitt, 1912.
- Microscope, compound: Zacharias Janssen, 1590.
- Microscope, electron: Vladimir Zworykin et al., 1939.
- Miner's safety lamp: Sir Humphry Davy, 1815.
- Monotype machine: Tolbert Lanston, 1887.
- Motion pictures: Thomas A. Edison, 1893.
- Motion pictures, sound: (Product of various inventions. First picture with synchronized musical score: *Don Juan*, Warner Bros., 1926. First picture with spoken dialogue: *The Jazz Singer*, Warner Bros., 1927.)
- Motor, A-C: Nikola Tesla, 1892.
- Ophthalmoscope: Hermann von Helmholtz, 1851.
- Phonograph: Thomas A. Edison, 1877.
- Photography, color: Gabriel Lippmann, 1891.
- Power loom: Edmund Cartwright, 1785.
- Printing, movable-type: Johann Gutenberg (?), c.1440.
- Printing press, rotary: Richard Hoe, 1847.
- Radar: Gregory Breit & Merle A. Tuve, 1925.
- Radio: (Product of various inventions. First practical system of wireless telegraphy: Guglielmo Marconi, 1895.)
- Radio telephone: Lee De Forest, 1906.
- Radio tube, diode: Sir John Ambrose Fleming, 1904.
- Radio tube, triode: Lee De Forest, 1906.
- Rayon: George Andemars (first known patent), 1855; perfected by Sir Joseph W. Swan, 1883.
- Reaper: Cyrus McCormick, 1834.
- Revolver: Samuel Colt, 1835.
- Rifle, automatic: John M. Browning, 1918.
- Rubber, vulcanized: Ch. Goodyear, 1839.
- Screw propeller: John Ericsson, 1837.
- Self-starter, automobile: Charles F. Kettering, 1911.
- Sewing machine: Elias Howe, 1846.
- Spinning frame: Sir Richard Arkwright, 1769.
- Spinning Jenny: James Hargreaves, 1764.
- Spinning mule: Samuel Crompton, 1779.
- Steamboat: Robert Fulton, 1807. (First commercially successful one in U.S.A.)
- Steam engine: James Watt, 1765. (First practical one.)
- Tank, military: Sir Ernest Swinton, 1914.

- Telegraph, electromagnetic recording:** Samuel F. B. Morse, 1837.
- Telephone:** Alexander Graham Bell, 1876.
- Telescope:** Hans Lippershey (?), c.1608.
- Television:** Successful demonstration by J. L. Baird in England and C. F. Jenkins in U. S., in early 1920's. (First commercial TV: July 1, 1941, over WNBT, New York.)
- Thermometer:** Galileo Galilei, 1593.
- Tire, pneumatic:** John B. Dunlop, 1888.
- Tractor, caterpillar:** Benjamin Holt, 1900.
- Transformer, electric:** Wm. Stanley, 1885.
- Transistor:** John Bardeen, William Shockley and Walter Brattain, 1948.
- Typewriter:** First practical one invented by Christopher Sholes, Carlos Glidden and Samuel W. Soule in 1867; patented by Sholes in 1868.
- Zeppelin:** Ferdinand von Zeppelin, 1900.
- Discoveries and Theories**
- Adrenaline, isolation of:** Jokichi Takamine, 1901.
- Aluminum manufacture by electrolytic action:** Charles M. Hall, 1886.
- Antitoxin, diphtheria:** Emil von Behring, 1890.
- Atom smashing with slow neutrons:** Enrico Fermi, 1934. (Experiment repeated by Lise Meitner and Otto Hahn in 1938.)
- Atomic numbers:** Henry Moseley, 1913.
- Atomic theory:** John Dalton, 1803.
- Aureomycin:** Benjamin M. Duggar, 1948.
- Bacteria:** Anton van Leeuwenhoek, 1683.
- Blood, circulation of:** William Harvey, 1628.
- Classification of plants and animals:** Carolus Linnaeus, 1737-53.
- Combustion, nature of:** Antoine Lavoisier, 1777.
- Conditioned reflex:** Ivan Pavlov, c.1910.
- Deuterium (heavy hydrogen):** Harold C. Urey, 1931.
- Displacement of water, principle of:** Archimedes, 3rd century B.C.
- Electromagnetic waves:** Heinrich Hertz, 1886.
- Electron:** Sir Joseph J. Thomson, 1897.
- Electron, wave nature of:** Louis Victor de Broglie, 1924.
- Ether, first used as anesthetic:** Crawford W. Long, 1842.
- Evolution by natural selection:** Charles Darwin, 1859.
- Falling bodies, law of:** Galileo Galilei, 1590.
- Gases, laws governing:** Joseph Gay-Lussac, 1809.
- Gravitation, law of:** Sir Isaac Newton, 1687.
- Helium on sun:** Sir Joseph Lockyer, 1868.
- Heredity, laws of:** Gregor Mendel, 1865.
- Induction, electric:** Joseph Henry, 1828.
- Insulin:** Sir Frederick G. Banting and J. J. R. MacLeod, 1922.
- Intelligence testing, modern:** Alfred Binet and Theodore Simon, 1905.
- Isotopes, mass spectra of:** Francis W. Aston, 1919.
- Isotopes, theory of:** Frederick Soddy, 1912.
- Light, electromagnetic theory of:** James Clerk Maxwell, 1873.
- Light, velocity of:** Olaus Römer, 1675.
- Molecular hypothesis:** Amadeo Avogadro, 1811.
- Neutron:** James Chadwick, 1932.
- Ohm's Law:** Georg S. Ohm, 1827.
- Ozone:** Christian Schönbein, 1839.
- Penicillin:** Sir Alexander Fleming, 1929.
- Periodic table:** Dmitri Mendeleev, 1869.
- Positron:** Carl D. Anderson, 1932.
- Proton:** Ernest Rutherford, 1919.
- Psychoanalysis:** Sigmund Freud, c.1904.
- Quantum mechanics:** Werner Heisenberg, 1925.
- Quantum theory:** Max von Planck, 1901.
- Rabies preventive:** Louis Pasteur, 1885.
- Radioactivity:** Antoine Becquerel, 1896.
- Radioactivity, artificial:** Frédéric and Irène Joliot-Curie, 1934.
- Relativity, theories of:** Albert Einstein, 1905-53.
- Salk antipolio vaccine:** Jonas E. Salk, announced successful 1955.
- Schick test of susceptibility to diphtheria:** Béla Schick, 1913.
- Secretin, isolation of:** Sir William Bayliss and Ernest Starling, 1902.
- Soda manufacture from salt:** Ernest Solvay, 1861.
- Solar system, heliocentricity of:** Nicolaus Copernicus, 1530. (Also Aristarchus of Samos, 3rd century B.C.)
- Spectrum analysis:** Robert Bunsen and Gustav Kirchhoff, 1859.
- Sulfa drugs as bactericides:** Gerhard Domagk, 1932.
- Surgery, antiseptic:** Sir Joseph Lister, 1867.
- Tuberculosis bacillus:** Robert Koch, 1882.
- Vaccination:** Edward Jenner, 1796.
- Virus, crystalized:** Wendell M. Stanley, 1935.
- Vitamin A:** Elmer V. McCollum and M. Davis, 1912-14.
- Vitamin B:** Elmer V. McCollum, 1915-16.
- Vitamin C:** A. Holst and T. Froehlich, 1912.
- Vitamin D:** Elmer V. McCollum, 1922.
- Vitamin 'D, irradiated:** Harry Steenbock, 1924.
- Wassermann test for syphilis:** August von Wassermann, 1906.
- Water, synthesis of:** Henry Cavendish, 1781.
- Wilson Cloud Chamber:** Charles T. R. Wilson, 1911.
- X-rays:** Wilhelm Roentgen, 1895.

The Races of Mankind

by PROFESSOR WILTON MARION KROGMAN

Graduate School of Medicine, University of Pennsylvania

Classification of Man into groups called "races" rests upon the basic fact that all peoples belong to the same genus and species, *Homo sapiens*. This is important to keep in mind, for it implies that all peoples are much more alike than different.

Scientists classify Man by using a number of physical traits, most of them based upon observation rather than upon precise measurement (blood-groups are an exception). Examples of these are stature and head-form (determined by a breadth/length ratio), skin color, hair color, form and texture, eye color, nose shape, mouth form, shape of face with special reference to cheekbones. Other criteria, such as arm and leg proportions, are more specialized. Two things are noteworthy: (1) most physical traits are external; (2) physical traits are so variable that a single trait has virtually no diagnostic value.

We may define a *race* as a sub-group of Mankind more or less set apart by a heritable combination of physical traits.

There are three, possibly four, great aggregates of races, usually called *stocks*: Caucasoid, Mongoloid, Negroid, and Archaic Caucasoid (or Australoid). The first three are often referred to as "White," "Yellow," and "Black." This is not really correct; peoples of North-Central India are Caucasoids, yet their skin color is brown to dark brown; certain tribes of Northeast Africa are Negroids, yet their skin color is light brown to brown. Variability also may be seen in stature: the tallest people in the world are found in Denmark and the Scottish Highlands, in East Africa, and in southernmost South America—respectively Caucasoid, Negroid, and Mongoloid. It must be re-emphasized that not one or two traits, but an aggregate of traits, of genetic origin, provides the only valid method of setting up stock or racial classification.

Caucasoids are the peoples of Europe, the adjacent shores of North Africa, and of Asia Minor and the northern half of India. The following races belong to the Caucasoid stock: Nordic, or Northwest European, Alpine or Central European, Mediterranean or Southwest European, Baltic or Northeast European, Dinaric or Southeast European, Armenoid in western Asia Minor, and Indic (often called Hindu) in North-Central India. These races are not, of course, absolutely limited to those geographical areas. For example, the Mediterranean race is found also in North Africa, especially Egypt, and in Asia Minor, where it is represented by the Bedouin Arabs of Arabia. Other Caucasoid peoples are the Magyars, the Finns, and the Lapps, who show traces of Mongoloid mixtures, especially the last.

The Negroids are the peoples of Africa and Oceania, termed respectively the African Negroids and the Oceanic Negroids. The following African Negroid races are commonly recognized: Forest or West African or "True" Negro in West Africa, Sudanic in Central Africa, Nilotic in East Africa, Hamitic in Northeast and North Africa, Bantu (better: Bantu-speaking) in South Africa, and Bushman-Hottentot in the Kalahari Desert of South Africa. The Oceanic Negroids are commonly called Melanesian or Papuan, and are found chiefly in Borneo, New Caledonia, the Solomons, the Hebrides and Fiji.

Of special interest among Negroids are Pygmies, who average about four feet in stature. They are found in Africa in the Congo region, in the Ituri Forest, and in Oceania on the Andaman Islands, the Malay Peninsula, the Philippines, and Borneo.

The Mongoloids are basically the peoples of Asia, but are also in the Western Hemisphere as the American Indians, and are represented in Malaysia and in Oceania. The Mongoloids are usually divided into the following races: Sinic of China and Japan, Palearctic of Siberia, Turkic and Tungic or Mongolic of Central Asia, and Malayan of Malaysia. In the Western Hemisphere they are found as Eskimos and the Indians of the Americas. In Polynesia, i.e., in Samoa, Tonga, Hawaii and west to Easter Island, the Mongoloid stock is a basic element, with some Caucasoid and some Negroid (Melanesian?) admixture.

The Archaic Caucasoids are found in Australia as the Australian aborigines and in Japan as the Ainu. They may possibly be an element in Melanesia and in Ceylon and South India, e.g., the Toda, the Vedda, and other tribes.

This is a brief survey of the "stocks" and "races" of the world. There is much intermixing and some overlapping. This leads to two very important biological observations: (1) *there are no pure races*; (2) *there are no superior or inferior races*. We know from history that all peoples, upon contact, have crossed their genetically based physical traits. We know from human anatomy that in fundamental structure all peoples are identical.

As far as biological Man is concerned, what he is, is related to his cultural environment, rather than to any innate (or inherited) ability or aptitude. There is no "German race," only a German nationality; there is no "Jewish race," only a Jewish socio-religious community; there is no "Aryan race," only an Aryan language; there is no "master race," only a political bombast!

Communicable Diseases

Source: *Control of Communicable Diseases in Man*, an official report of the American Public Health Assn.

Disease	Incubation period*	Period of communicability
Chickenpox (varicella).....	2 to 3 weeks	From 1 day before appearance of vesicles to 6 days after.
Common cold.....	12 to 72 hours; usually 24 hrs.	From 1 day before onset to 5 days after.
Conjunctivitis.....	1 to 3 days	During course of active infection.
Diphtheria.....	2 to 5 days	Usually 2 weeks or less; seldom more than 4 weeks.
Dysentery, amebic.....	3 to 4 weeks (varies widely)	During infection; possibly for years if untreated.
Food poisoning: Botulism.....	Within 18 hours	Not applicable.
Salmonella infection.....	6 to 48 hours in epidemics	3 days to 3 weeks (extremely variable).
Staphylococcus intoxication.....	½ to 4 hours	Not applicable.
German measles (rubella).....	14 to 21 days; usually 18	At least 4 days after onset of catarrhal symptoms.
Gonorrhea.....	3 to 9 days; sometimes 14	Indefinitely unless treated.
Impetigo contagiosa.....	Within 5 days; often 2	Until lesions are healed.
Influenza.....	1 to 3 days	Probably 1 week after onset.
Measles (rubeola).....	10 days (to onset) 14 days (to rash)	From 4 days before rash appears to 5 days after.
Meningitis, meningococcal.....	2 to 10 days	1 day after appropriate medication.
Mumps.....	12 to 26 days; commonly 18	From 2 days before onset to 9 days after, or until swelling subsides.
Pneumonia: Bacterial.....	Believed to be 1 to 3 days	Unknown.
Virus.....	Believed to be 7 to 21 days; commonly 12	Unknown.
Polio myelitis.....	7 to 21 days; commonly 12	From late incubation to first few days after onset; persists in feces for 3 to 6 weeks or more.
Rabies (Hydrophobia).....	2 to 6 weeks or longer	Rarely communicated from man to man.
Rheumatic fever.....	Not applicable†	Not known to be communicable.
Scarlet fever and streptococcal sore throat.....	2 to 5 days	During incubation and clinical illness, about 10 days. May last for months in untreated patients.
Smallpox.....	7 to 16 days; commonly 12	From first symptoms to disappearance of scabs and crusts, a period of 2 to 3 weeks.
Syphilis.....	10 days to 10 weeks; usually 3 weeks	Variable and not definitely known.
Tetanus.....	4 days to 3 weeks	Not communicable from man to man.
Trichinosis.....	2 to 28 days after eating infected meat; usually 9 days	Not directly transmitted from man to man.
Tuberculosis.....	4 to 6 weeks (to primary phase)	As long as tubercle bacilli are discharged by patient.
Typhoid fever.....	1 to 3 weeks	As long as typhoid bacilli appear in excreta; 2 to 5% of patients become permanent carriers.
Whooping cough (pertussis)....	Commonly 7 days, almost uniformly within 10 days, and not exceeding 21 days	From 7 days after exposure to 3 weeks after onset of typical paroxysms.

* Usual limits. † Usually precipitated by a previous infection.

Gestation, Incubation and Longevity of Certain Animals

Hamster, golden.....	15-19	2	Wolf.....	63	10-12 (16)
Hippopotamus.....	220-255	30 (49+)	Woman.....	270+ or -	72†

* Depending on kind. † Latest life expectancy charts list this age.

RELIGION

Principal Religions of the World

Source: Encyclopædia Britannica.

Statistics of the world's religions are only very rough approximations. Aside from Christianity, few religions, if any, attempt to keep statistical records; and even Protestants and Catholics employ different methods of counting members. All persons of whatever age who have received baptism in the Catholic Church are counted as members, while in most Protestant Churches only those who "join" the church are numbered. The compiling of statistics is further complicated by the fact that in China one may be at the same time a Confucian, a Taoist and a Buddhist. In Japan, one may be both a Buddhist and a Shintoist.

Religion	North America	South America	Europe	Asia	Africa	Oceania ¹	Total
Christian—Total.....	160,760,567	117,397,913	456,357,814	47,175,262	30,879,417	10,828,482	820,399,455

¹ Includes Australia, New Zealand and Oceania. ² Includes Catholics in Central America and the West Indies. ³ Includes Communist-controlled Eurasia. ⁴ Includes total Jewish population whether or not related to the synagogue.

History of Leading Religious Groups in the United States

(50,000 members or over; figures are for continental U. S.)

Source: Yearbook of American Churches.

Baptist

American Baptist Association.—A group of Independent Missionary Baptist Churches organized into an association in 1905. Members (1956): 600,000.

American Baptist Convention.—The early historical local independency of Baptist churches in America tended to impede the formation of any general organization until in 1814 a General Missionary Convention was formed to permit Baptists to express themselves in terms of missionary activities. In 1845, the state conventions in the South withdrew to organize the Southern Baptist Convention. In 1907, the Northern Baptist Convention was organized, a delegated body under whose direction the many agencies of the Baptists in the North and West now operate. In May, 1950, the name was changed to the American Baptist Convention. Members (1956): 1,528,210.

Baptist General Conference of America.—Formerly known as the Swedish Baptist General Conference of America. It has operated as a general conference since 1879. Members (1956): 59,304.

Conservative Baptist Association of America.—Organized in 1947, it is a body

with no authority over the local churches. Adherents consider the Bible infallible. Members (1956): 250,000.

Free Will Baptists.—A body of Arminian Baptists, organized in 1787 by Benjamin Randall in New Hampshire. Members (1956): 163,619.

The General Association of Regular Baptist Churches.—Founded in 1932 in Chicago by a group of churches which had withdrawn from the Northern Baptist Convention. Members (1956): 129,100.

General Baptists.—An Arminian group of Baptists, organized in 1607 and transplanted to the Colonies in 1714. It died down in the East but was revived in the Midwest in 1823 under Rev. Benoni Stinson. Members (1956): 55,300.

National Baptist Convention, U. S. A., Inc.—The older and parent convention of Negro Baptists. This body is to be distinguished from the National Baptist Convention of America, usually referred to as the "unincorporated" body. Members (1954): 4,557,416.

National Baptist Convention of America.—This is a body usually referred to as the "unincorporated" convention, not to be confused with the "incorporated" National

Baptist Convention, U. S. A., Inc., from which this body withdrew. Organized in 1895. Members (1956): 2,668,799.

National Baptist Evangelical Life and Soul Saving Assembly of U. S. A.—Organized in 1921 by A. A. Banks, Sr., as a charitable, educational, and evangelical organization. Members (1951): 57,674.

National Primitive Baptist Convention of the U. S. A.—A group of Negro Baptists opposed to all forms of church organization. Members (1952): 80,000.

North American Baptist Association.—Organized 1950 in Little Rock, Ark., as the result of a division in the American Baptist Association. In theology these churches are militantly fundamentalist. Members (1956): 261,202.

Primitive Baptists.—A large group of Baptists, largely through the South, who are opposed to all centralization, to modern missionary societies, and to Sunday schools. They are sometimes called "anti-missionary" Baptists. Members (1950): 72,000.

Southern Baptist Convention.—In 1845, Southern Baptists withdrew from the General Missionary Convention over the question of slavery and other matters and formed the Southern Baptist Convention. Members (1956): 8,700,481.

United Baptists.—This group dates from meetings of Regular Baptists and Separate Baptists held in Richmond, Va., in 1787, and a meeting under the name United Baptists in Clark County, Ky., in 1801. Members (1955): 63,641.

The United Free Will Baptist Church.—A body which set up its organization in 1901. Though ecclesiastically distinct, they are in close relations with the Free Will Baptists. Members (1952): 100,000.

Catholic and Orthodox

Armenian Apostolic Church of America.—The American branch of the Ancient Church of Armenia. Established in the U. S. in 1889. Diocesan organization under the jurisdiction of the Holy See of Etchmiadzin, Armenia, U.S.S.R. Members (1956): 102,900.

The American Carpatho-Russian Orthodox Greek Catholic Church.—This church is a self-governing diocese in communion with the Ecumenical Patriarchate of Constantinople. On Sept. 19, 1938, the late Patriarch Benjamin I canonized the diocese in the name of the Orthodox Church of Christ. Members (1955): 100,000.

Greek Archdiocese of North and South America.—Greek-speaking Orthodox Christians have had parishes in the U. S. for the last seventy years. These were first under the jurisdiction of the Metropolitan of Athens and later under the Patriarchate of Constantinople. Political changes in Europe have been reflected in this country

and have brought difficulties in all branches of the Orthodox Church. In 1931, a general convention held in New York City under the presidency of Archbishop Athenagoras brought a large measure of unity and order. Members (1956): 1,150,000.

North American Old Roman Catholic Church.—This body is identical with the Roman Catholic Church in worship, faith, etc., but differs in discipline. It was received into union with the Eastern Orthodox Church by the Archbishop of Beirut in 1911 and by the Orthodox Patriarch of Alexandria in 1912. Members (1956): 84,142.

Polish National Catholic Church of America.—After long dissatisfaction with Roman Catholic Administration in many Polish parishes, this group was organized in 1904. Members (1956): 250,000.

The Roman Catholic Church.—The largest single group of Christians in the U. S., the Roman Catholic Church is under the spiritual leadership of Pope Pius XII. This group dates back to the priests who accompanied Columbus on his second voyage to the New World. A settlement, later discontinued, was made at St. Augustine, Fla. The continuous history of this Church in the colonies began at St. Mary's in 1634, in Maryland. Members (1956): 34,563,851.

Romanian Orthodox Episcopate of America.—This body of Eastern Orthodox Christians of Rumanian descent is under the spiritual supervision and canonical jurisdiction of the Bishop of the Romanian Orthodox Church of North and South America. Members (1956): 50,000.

The Russian Orthodox Church Outside Russia.—Organized in 1920 to unite the missions and parishes of the Russian Orthodox Church outside of Russia. Members (1951): 55,000.

The Russian Orthodox Greek Catholic Church of America.—The Russian Orthodox Catholic Church entered Alaska in 1792. In 1872, its headquarters were moved from Sitka to San Francisco and, in 1905, to New York. It administers churches in the U. S., Canada, Alaska, Aleutian Is., South America and Japan. Members (1956): 760,000.

NOTE: Compiled from figures furnished by 258 of the 268 religious bodies in the U. S.

Serbian Eastern Orthodox Church.—This body of the Eastern Orthodox Church has its own diocese and is under jurisdiction of the Serbian Patriarchate (Yugoslavia). Members (1955): 100,000.

Syrian Antiochian Orthodox Church.—This body is a division of the Orthodox Church which is under the jurisdiction of the Patriarch of Antioch. It is a member of the Federation of Orthodox Greek Catholic Churches in America. Members (1956): 110,000.

Ukrainian Orthodox Church of U.S.A.—This church was organized in the U. S. in 1919. Members (1956): 83,000.

Lutheran

American Lutheran Church.—This Church is a constituent body of the American Lutheran Conference. It is itself the result of the merger in 1930 of the Evangelical Lutheran Joint Synod of Ohio and Other States (org. 1918), the Evangelical Lutheran Synod of Iowa and Other States (org. 1854), and the Lutheran Synod of Buffalo (org. 1845). Members (1955): 871,446.

Augustana Evangelical Lutheran Church.—This group, whose constituency originally was of Swedish extraction, is a member of the American Lutheran Conference and is also a participating body in the National Lutheran Council. Organized in 1860. Members (1956): 549,604.

Evangelical Lutheran Church.—In 1917 the United Norwegian Church, the Norwegian Synod and the Hauge Synod united under the name, Norwegian Lutheran Church of America. In 1930 this group became a constituent part of the American Lutheran Conference. The new name, The Evangelical Lutheran Church, was adopted at its General Convention in 1946. Members (1956): 1,021,058.

The Evangelical Lutheran Joint Synod of Wisconsin and Other States.—This group, a constituent part of the Synodical Conference, was organized in Wisconsin in 1850. Members (1956): 339,106.

Lutheran Church-Missouri Synod.—This group, the largest constituent part of the Synodical Conference, was organized in 1847, holds to an unwavering confessionalism and is the leader in the conservative group among the Lutherans. Members (1956): 2,076,550.

Lutheran Free Church.—This body was organized in 1897 as the result of differences of opinion in the United Norwegian Church over control of the Augsburg Seminary. It became a constituent part of the American Lutheran Conference in 1930. Members (1956): 78,155.

United Evangelical Lutheran Church.—This synod was organized in 1896 in Minneapolis by a merger of the two former

Danish Lutheran Synods in America—the Danish Ev. Luth. Church Conference (1884) and the Danish Ev. Luth. Church in North America (1893). Members (1955): 54,098.

United Lutheran Church in America.—This group dates back to the Ministerium of Pennsylvania, organized in 1748, and beyond that to early colonial days. It represents the union of the General Synod, General Council, and United Synod of the South in 1918. Members (1956): 2,174,500.

Methodist

African Methodist Episcopal Church.—This group was formed in Philadelphia in 1816 and extended throughout the South after the Civil War. Members (1951): 1,166,301.

African Methodist Episcopal Zion Church.—This group was organized in 1796, coming out of the John Street Methodist Church, New York. Members (1956): 761,000.

Christian Methodist Episcopal Church.—In 1870, the General Conference of the M.E. Church, South, approved the request of its colored membership for the formation of their conferences into a separate body. Members (1951): 392,167.

Free Methodist Church of North America.—This body, organized in 1860, grew out of a movement in the Genesee Conference of the Methodist Episcopal Church towards a more original Methodism. Members (1956): 54,014.

The Methodist Church.—In April, 1939, the Uniting Conference forming The Methodist Church was held by representatives of the Methodist Episcopal Church, the Methodist Episcopal Church, South, and the Methodist Protestant Church. The Methodist Church in the United States originated with the efforts of John and Charles Wesley, leaders of the revival movement in England in the eighteenth century. Methodist emigrants from Ireland planted Methodism in America about 1760. In 1771 Francis Asbury, one of Wesley's preachers, later a Bishop, landed in Philadelphia. The Methodist Episcopal Church was organized in 1784-85. The Methodist Episcopal Church, South, dated from 1846, the separation from the Methodist Episcopal Church having taken place over the slavery issue. The Methodist Protestant Church dated from 1830, and was organized over the issue of lay representation. Members (1956): 9,422,893.

Presbyterian

Cumberland Presbyterian Church.—In 1806, a presbytery (Cumberland) of the Presbyterian Church was dissolved by the Synod of Kentucky on account of its attitude toward revivalism. Members of the presbytery organized as an independent

body in 1810 and became the Cumberland Presbyterian Church. When this body attempted to reunite with the Presbyterian Church in 1906, a minority preferred to continue as an independent church. Members (1956): 85,651.

Presbyterian Church in the U. S.—This group is the branch of the Presbyterian Church which separated from the main body at the time of the Civil War. It is often called the "Southern" Presbyterian Church. Members (1956): 829,570.

Presbyterian Church in the United States of America.—This group appeared among the earliest colonists of America. Its first church was established about 1640. Members (1956): 2,717,320.

United Presbyterian Church of North America.—This group dates back to the Reformed Presbyterian (Covenanter) Church (1643) and the Associate Presbyterian (Seceder) Church (1733), both of Scotland. These two groups appeared in America in 1774 and 1753 respectively. They united and became the Associate Reformed Presbyterian Church in 1782. A minority, however, continued as the Associate Presbyterian Church. In 1858 the two groups united and became the United Presbyterian Church. Members (1956): 251,344.

Other Religious Bodies

Apostolic Overcoming Holy Church of God.—A Negro body incorporated in Alabama in 1919. Members (1951): 75,000.

Assemblies of God.—Independent, pentecostal, evangelical, missionary churches associated for co-operative effort in district and general councils. Organized in Arkansas in 1914. Members (1956): 470,361.

Buddhist Churches of America.—Organized in 1914 as the Buddhist Mission of North America, this group was incorporated in 1942 under the present name and represents Buddhism in this country, the faith based on "the anatman doctrine, supplemented by the idea of karma, and nirvana, the holy ease or a blissful mental state of absolute freedom from evil." Members (1954): 63,000.

Christ Unity Science Church, Inc.—Established 1810. Members (1953): 1,581,286.

The Christian and Missionary Alliance.—An evangelical, evangelistic and missionary movement organized in 1887. It stresses "the deeper Christian life and consecration to the Lord's service." Members (1954): 57,109.

Christian Reformed Church.—A group of Dutch Calvinists which dissented from the Reformed Church in America in 1857 and which was strengthened by later accessions from the same source and by immigration. Members (1956): 211,454.

Church of Christ, Scientist.—Founded by Mary Baker Eddy in 1879. As defined by

Mrs. Eddy, Christian Science is the scientific system of divine healing and the reinstatement of primitive Christianity.*

The Church of God.—Inaugurated by Bishop A. J. Tomlinson, who served as General Overseer 1903-43. Episcopal in administration. Members (1955): 70,941.

Church of God (Anderson, Ind.).—This group is one of the largest of the groups which have taken the name "Church of God." Its headquarters are at Anderson, Ind. It originated about 1880. Members (1956): 127,395.

Church of God (Cleveland, Tenn.).—This body, to be differentiated from the Church of God at Anderson, Ind., is a holiness group and pentecostal. It began in 1886 in Tennessee, under the name of Christian Union, reorganized in 1902 as the Holiness Church. In 1907 it adopted the name above. Members (1956): 147,929.

Church of God in Christ.—Organized in Arkansas in 1895, by C. P. Jones and C. H. Mason, who believed there was no salvation without holiness; incorporated 1897. Members (1956): 360,428.

Church of the Brethren (Conservative Dunks).—German pietists from Crefeld, Germany, under the leadership of Peter Becker, entered the colonies in 1719, and settled at Germantown, Philadelphia, Pa. They were called Dunks (baptizers) and were immersionists. The members are conservative as to attire, oaths or affirmations, resistance to force, temperance, and the like. Members (1956): 197,290.

Church of the Nazarene.—One of the larger holiness bodies, organized in Pilot Point, Tex., Oct. 1908. It is in general accord with the early doctrines of Methodism and emphasizes entire sanctification. Members (1956): 277,618.

Churches of Christ.—This body is made up of a large group of churches, formerly reported with the Disciples of Christ, but since the religious census of 1906, reported separately. They are strictly congregational and have no organization larger than the local congregation. Members (1956): 1,700,000.

Congregational Christian Churches.—Congregational churches date back to the Pilgrim Fathers and the early colonists of New England in 1620. The Christian churches date back to the Wesleyan and revival movements at the end of the eighteenth century. These two groups of churches were merged at Seattle, Wash., in 1931. Members (1956): 1,379,394.

Disciples of Christ.—In the revival period of the early nineteenth century, a movement under Thomas Campbell and his son, Alexander, resulted in the establishment of a fellowship called Christians

*Membership figure not available. The manual of the church forbids "the numbering of people and the reporting of such statistics for publication."

or Disciples. They believe that sects are unscriptural. Members (1956): 1,922,484.

Evangelical and Reformed Church.—This body was formed on June 26, 1934, at Cleveland, Ohio, by a union of the Evangelical Synod of North America and the Reformed Church in the United States. The union was unique in that it left all details to be adjusted afterwards. The constitution was declared in effect at the General Synod which met at Lancaster, Pa., in June 1940. Members (1956): 784,270.

Evangelical Mission Covenant Church of America.—A transplantation to the U. S., in 1885, of a free-church movement in the Swedish state church. Until recently the name has been the Swedish Evangelical Mission Covenant. Members (1956): 55,311.

The Evangelical United Brethren Church.—This group had its origin in Johnstown, Pa., November 16, 1946, in the consummation of organic union between the Evangelical Church and the Church of the United Brethren in Christ. Both these former communions had their beginning in Pennsylvania in the evangelistic movement of the early 19th century. Jacob Albright was the founder of the Evangelical Church, and Dr. Philip William Otterbein was the founder of the United Brethren Church in 1800. Members (1956): 742,537.

Friends, The Five Years Meeting of.—The Five Years Meeting of Friends was formed in 1902 by 13 Yearly Meetings entering into a loose confederation. Since then, two of the original Yearly Meetings have withdrawn (Kansas and Oregon) and three Yearly Meetings outside the U. S. have joined. Members (1956): 73,095.

International Church of the Foursquare Gospel.—An evangelistic missionary body organized by Aimee Semple McPherson in 1927. The parent church is Angelus Temple in Los Angeles. Members (1956): 110,568.

Jehovah's Witnesses.—A group calling themselves primitive Christians. They believe that the Kingdom under Christ will replace all earthly governments. Members (1956): 189,517.

Jewish Congregations.—Jews arrived in the colonies before 1650. The first congregation is recorded in 1656, in New York City, the Shearith Israel (Remnant of Israel). Members (1954): 5,500,000.

Latter-day Saints, Church of Jesus Christ of.—A group in which the Bible, the Book of Mormon, the Doctrine and Covenants and the Pearl of Great Price are regarded as the word of God. The primitive church organization is sought. Members (1956): 1,289,581.

Latter-day Saints, Reorganized Church of Jesus Christ of.—A division among the Latter-day Saints (Mormons) occurred on the death of Joseph Smith in 1844. His son, Joseph Smith, became presiding officer of

this group, which has headquarters at Independence, Mo. Members (1956): 142,480.

Mennonite Church.—The largest group of the Mennonites who began arriving in the U. S. in 1683, settling in Germantown, Pa. They derive their name from Menno Simons, born 1496. Members (1956): 70,513.

Moravian Church (Unitas Fratrum).—In 1735, Moravian missionaries of the pre-Reformation faith of John Huss came to Georgia and, in 1740, to Pennsylvania. They established the Moravian Church. Members (1956): 56,449.

Pentecostal Assemblies of the World, Inc.—A pentecostal holiness group originating in the early part of the century and found largely in the Midwest. Members (1954): 60,000.

Pentecostal Church of God of America, Inc.—Organized in 1919 at Chicago, Ill. Members (1956): 103,500.

The Protestant Episcopal Church.—This group entered the colonies with the earliest settlers as the Church of England. It became autonomous, adopted its present name in 1789. Members (1956): 2,852,965.

Reformed Church in America.—This group was established by the earliest Dutch settlers of New York as the Reformed Protestant Dutch Church in 1628. Members (1956): 208,999.

The Salvation Army.—An evangelistic organization, with a military government, first set up by General William Booth in England and introduced into the U. S. in 1880. Members (1956): 247,964.

Seventh-day Adventists.—This body developed out of the Adventist movement (1833-1844), which emphasized the imminent personal return of Jesus Christ. It emphasized the observance of the seventh-day Sabbath and in 1863 was numerous enough to organize a conference. Members (1956): 283,140.

Spiritualists, International General Assembly of.—Organized in Buffalo, N. Y., in 1936. Members (1956): 164,072.

Unitarian Churches.—The Unitarian movement in Congregationalism, beginning in the eighteenth century, produced the American Unitarian Association in 1825. In 1865 a national conference was organized. Members (1956): 101,549.
